**PHILADELPHIA.**—Honey has been arriving quite freely during the last ten days; but owing to the quantity kept back by the producers the markets are somewhat unsettled. We quote: Fancy white comb honey, 15 to 16; No. 1 white, 14 to 15; amber, 13; fancy white extracted in 60-lb. cans, 8 to 9; amber, ditto, 6 to 8 according to quality and flavor. Beeswax, 28.

Oct. 23.

WM. A. SELSER,  
Philadelphia, Pa.

**KANSAS CITY.**—The market is pretty well supplied with comb honey. On account of the warm weather the demand has been light; but with the advent of cold weather we look for a much better demand. The receipts of extracted honey are very light, but the demand is good. We quote No. 1 white comb honey, 24 sections, \$3.00 to \$2.75; white extracted, 8; amber, 7 to 7½. Beeswax, 28.

Oct. 22.

C. C. CLEMONS PRODUCE CO.,  
Kansas City, Mo.

**BUFFALO.**—The demand is improving on the better grades of comb honey. Dark honey is scarcer than usual, and all No. 1 stock is bought up at good fair prices. Stocks of all kinds are light in the market, and we look for an advance in price before long. Big buyers are looking for white-clover extracted, but there is hardly any here in the market. No. 1 to fancy white-clover comb honey, 14 to 15; No. 2 ditto, 10 to 12; No. 1 dark comb honey, 12 to 13; No. 2 ditto, 9 to 10; white-clover extracted, 7 to 8; dark, 6 to 7. Jelly-tumblers, white extracted honey, 85 to 90 cts. per dozen. Beeswax, 28 to 30.

Oct. 23.

W. C. TOWNSEND,  
Buffalo, N. Y.

**ZANESVILLE.**—If any change, the market here shows a little better tone as regards demand, though there is a tendency on the part of some commission men to cut prices. No. 1 to fancy comb should bring on arrival about 13 cts.; extracted, 7½. No. 1 to fancy comb sells to the grocery trade at 15 to 16½. 1 quote clover extracted in five-gallon cans at 9½ to 10. For beeswax of good quality I offer 28 cts. cash or 30 in exchange for supplies.

Oct. 20.

E. W. PEIRCE,  
Zanesville, O.

**CHICAGO.**—Beginning with this month, and up to the present writing, there has been a fair movement of honey, both comb and extracted; but it may be the weather, or a combination of causes, for the volume of business is not equal to preceding years at this time, despite the fine quality of nearly all the consignments received here. We are hoping that the winter consumption will be much above the normal, because of the superior quality. A No. 1 to fancy comb sells at 13 to 14; No. 1 at about 12½, and other grades from one to three cents less. Extracted honey is steady at from 7 to 8 for the light grades, and 6 to 6½ for the amber; dark grades, according to body, flavor, and package. Beeswax is meeting with ready sale at 30 for yellow, free from impurities.

Oct. 17.

R. A. BURNETT & Co.,  
Chicago.

**ST. LOUIS.**—Since our last, of Oct. 5, the honey market has continued in the same condition. The demand for all grades of honey is limited, and quotable as follows: Fancy white comb honey, 12 to 12½; choice amber, 11 to 12; dark amber, 9 to 10; broken or leaking honey sells at considerably less. Choice amber honey in barrels and half-barrels, 5½ to 6; in five gallon cans, 6½ to 7; dark and inferior grades rule at less. Beeswax, 28½ for choice pure.

Oct. 17.

R. HARTMANN PRODUCE CO.,  
St. Louis, Mo.

**ALBANY.**—Steady receipts are increasing somewhat; also consumption as the weather grows cooler. We quote: Fancy white, 16; A No. 1, 15; No. 1, 14½ to 15; buckwheat, 13 to 14; extracted, white, 7½ to 8; buckwheat and mixed, 7. Beeswax, 30 to 32.

Oct. 22.

H. R. WRIGHT, Albany.

**DENVER.**—The local market on honey has continued weak. During the past two weeks we have had unusually warm weather, which may partly be the cause for it. Demand for comb honey in car lots is better than expected. We quote No. 1 white comb honey, per case of 24 sections, \$3.15; No. 1 light amber, \$3.00; No. 2, \$2.85; strained and amber extracted, 6¾ to 7¾; light amber, 7½ to 8¾; white extracted, 8½. We pay 24 cents for clean yellow beeswax delivered here.

Oct. 17.

THE COLORADO HONEY PRODUCERS' ASS'N.,  
Denver, Col.

**CINCINNATI.**—The market on comb honey is more active, and there are some large lots moving. There will be no big prices, due to the fact that there is considerable old honey left over from last year. No. 1 white comb honey is selling at 14 to 15 in small lots. Dark or off grades of honey are not selling at any price. There is practically no demand for it. Amber honey is in good demand at 6½ to 7. White-clover honey is selling at 8 cts. in 60-lb. cans; water-white sage, fancy, 9. Beeswax is in fair demand, selling at 30. The above quotations are what we are selling at.

Oct. 22.

C. H. W. WEBER,  
Cincinnati, O.

# GLEANINGS IN BEE CULTURE

Established  
1873.  
Circulation  
32,000.  
72 pages.  
Semi-  
monthly.

Devoted to Bees, Honey, and Home Interests.

Published by THE A. I. ROOT CO., Medina, Ohio.  
J. T. CALVERT, Business Manager.

\$1 per year.  
When paid  
in advance:  
2 years, \$1.50.  
3 years, \$2.00.  
5 years, \$3.00.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila, Samoa, Shanghai, Canal Zone, Cuba, and Mexico. Canadian postage is 30c per year. For all other countries in the Postal Union add 60 cents per year postage.

CHANGE OF ADDRESS. When a change of address is ordered, both the new and the old address must be given. The notice should be sent two weeks before the change is to take effect.

DISCONTINUANCES. We give notice just before expiration and further notice if the first is not heeded, before discontinuing. Subscribers are urged to renew promptly in order to avoid interruption in receipt of GLEANINGS, or if unable to make payment at once, to advise us when they can do so, which will be considered as an order to continue. Any one wishing his subscription discontinued should so advise us upon receipt of expiration notice and he will not be annoyed by further notices.

HOW TO REMIT. Remittances should be sent by Draft on New York, Express-order or Money-order, payable to order of The A. I. Root Company, Medina, Ohio. Currency should be sent by Registered Letter.

AGENTS. Representatives are wanted in every city and town in the country. A liberal commission will be paid to such as engage with us. References required.

## Foreign Subscription Agents.

Foreign subscribers can save time and annoyance by placing their orders for GLEANINGS with any of the following authorized agents, at the prices shown:

## PICTORIAL REVIEW.

A monthly beautifully illustrated. A few of the many departments and features: Home Care for Common Ills; Marketing for the Month; Kitchen Step-savers; Labor-saving Suggestions; House-building Plans; Millinery Lessons; Flower Gardens. Special Articles: Newest Fashions; Styles for Children; Home Dressmaking Lessons; Recipes; Home Furnishing; Entertaining and Etiquette; How to Earn Money at Home, etc.

## LADIES' WORLD.

A monthly; an ideal publication for women and the home. A thoroughly practical household magazine, and treats of every subject of interest to women. Clean and wholesome, elevating in tone and entirely free from sensationalism. An up-to-date dressmaking and pattern department.

## MODERN PRISCILLA.

A monthly devoted to all kinds of needlework. Recognized as the leading fancy-work magazine of America, the authority on all kinds of embroidery, knitting, crochet, lace, costumes, lingerie, and home decoration. Gives practical patterns and instructions in all kinds of needlework.

## GLEANINGS IN BEE CULTURE.

A semi-monthly. The leading bee-magazine of the world. A glance at its pages will convince any bee-keeper that it is a magazine he can not afford to be without. The information it gives on all questions relating to the subject are invaluable to the bee-keeper, whether he has one colony or hundreds, and even if you are not a bee-keeper you will enjoy reading the paper. Interesting home and garden departments.

No substitutions of other publications can be made in this offer. Present subscribers to this paper can have GLEANINGS sent to some bee-keeping friend, and the other three papers to their address.

**THE A. I. ROOT COMPANY, : : : MEDINA, OHIO**

# Convention Photo.

The Detroit convention of the National Bee-keepers' Association has been equaled in numbers only twice—at the World's Fair and at the Los Angeles convention. There were probably over 250 in attendance—at least, a group containing 238 members was photographed, and it is never possible to choose a time when every member is present. I employed a local photographer who is an expert in taking groups of this kind. He makes a specialty of this class of work, and has all of the necessary paraphernalia, including an 18x22 camera and set of seats like those used in a circus-tent. These seats are loaded upon a dray, hauled to the spot and set up, thus allowing of the posing of the members in tiers, one above the other. I selected the location and the time of the day when the light would be the best, and the result is a magnificent photograph of a convention group, such as has never been equaled, and probably will never be even approached. There was a combination of circumstances: First, the gathering together of the leading bee-keepers; then the seats upon which to group them in a mass so that the camera could be set up close to them; then the camera of large size, and a man who knew how to use it; and last, but not least, the proper lighting conditions. The artist who took the group told me he had taken probably 500 groups of this kind, but never one that was more nearly perfect than this one in *every respect*—not a person moved—every face is as bright, sharp, and clear as though taken in a gallery. Then the large size of the camera allowed the faces to be made of good size. I paid the photographer \$25.00 to make the negative, and consider it money well spent, as I have a group-picture of the leading bee-keepers of this country that has never been approached in size or execution. I am proud of it, and shall have it framed and hung in my office by the side of my desk, where, in the intervals of my work, I can sometimes glance at the faces of those friends with whom I have passed so many delightful hours. Just think of having, all upon one sheet, nice clear pictures of such men as N. E. France, Geo. W. York, A. I. Root, E. R. Root, Huber H. Root, L. A. Aspinwall, Fred W. Muth, R. F. Holtermann, T. F. Bingham, Wm. McEvoy, R. L. Taylor,

W. L. Coggsball, O. L. Hershiser, Prof. E. F. Phillips, E. M. Hunt, W. D. Soper, A. G. Woodman, H. C. Ahlers, J. L. Byers, J. E. Hand, F. J. Miller, E. E. Coveyou, E. B. Tyrrell, and Chalon Fowls; but there is little use in mentioning names, as there is no stopping-place. Another thing: Many of these men were accompanied by their wives, and some by their children, all of whom appear in the group.

But I have not yet mentioned the crowning feature. There is not much satisfaction in looking over a group of this kind if you can recognize, perhaps, only half a dozen faces, but I spent one whole day in securing the names and addresses of those in the group, giving each person a number. In other words, the members are numbered from 1 to 238, the numbers being placed upon the shoulder or some part of the person; then the list of members, together with their postoffice addresses, are printed and placed below the group, and the corresponding or proper number placed in front of each name. For instance, if you wonder who is No. 83, look in the list and it is H. G. Sibbald, Claude, Ontario. In this way every member can be identified—you can see exactly what kind of looking man is some one whose writings you may have followed for years.

The picture is printed upon a semi-mat carbon paper that gives beautiful soft tones in black and white, and mounted upon the very heaviest ash-gray mount, 20x24 inches in size, packed between two sheets of cellular board, and sent by express, *prepaid*, safe arrival in perfect condition guaranteed, for only \$1.50; or for \$2.00 I will send you the picture and the *Review* for 1908 and 1909. Send for sample copies of the *Review*, and a circular giving some of the principal topics that have been discussed in 1908.

One more point: After you receive the picture, if you should not care to keep it, feel *perfectly free* to return it, at my expense, when your money will be returned. Get this photo; have it framed, hang it in your home, and I am sure there is no picture that you will look at more often or with more pleasure. As a bee-keeper and a photographer I am proud of it.

W. Z. HUTCHINSON, Flint, Mich.

## A Year's Work in an Out-apiary

or, How to Control Swarming with Any Hive,  
Either for the Production of Comb or Extracted  
Honey. By G. M. DOOLITTLE.

Price 50 cts. postpaid.

This is the long-promised volume, just issued from the press of The A. I. Root Company. It contains 60 pages the size of this journal, describing Doolittle's system of comb-honey production, and how he managed to control swarming in particular. He has been writing on the subject of bees for over forty years. During all of that time he has made his bees pay, and pay handsomely. Just how he has been doing this is fully explained in this work.

The regular price of this work is 50 cents; but to introduce it among our readers we offer it in combination with one year's subscription to GLEANINGS for the regular price of the journal; namely, \$1.00, providing all arrearages are paid, if any; and \$1.00 for one year in advance. Those whose subscriptions are about to expire should renew at once, for the condition of our offer is that the subscription money, \$1.00, *must* be received before the expiration of your subscription. As there have been only a limited number of copies of the book printed, if you desire to secure one you had better renew at once, even if your subscription has some time to run, so as to be sure to get one.

### THE BEST FENCE.

There can be no doubt as to what constitutes the best fence for all kinds of domestic animals. It is the woven-wire fence as now made by the best manufacturers in America. Animals are totally prevented from getting out, yet at the same time they can not hurt themselves as they used to do with some of the other fences. For instance, the barbed-wire fence injured a great number of animals during the year, and even now it still injures a good many. Enormous numbers of cattle had their hides lacerated by the barbs, with the result that their hides, when sold, brought much less money. It was and still is a *barb-arious* contrivance for controlling stock. The woven-wire fence is now so cheap and effective that there is but little excuse for any farmer putting up any thing else to control his stock. Moreover, it is neater and more slightly in every way than almost any other form of fence unless it is a hedge. One of the best makers of this kind of fence is the Coiled Spring Fence Co., of Winchester, Ind., who make a splendid article, galvanized, etc., to make it last for many years. They are always glad to correspond with any one having a fence to put up. They are a good reliable concern.

### THE HONEY MARKET.

We are taking special pains this season to get complete and accurate accounts of the state of the honey market in every center of trade in this country, and to some extent, also, in Europe. If our honey-producers will carefully study these reports we think such a thing as a glut of honey at any one point can be avoided. Before shipping, carefully consider all the facts. You will note some places seem to have an oversupply right now, while at others there is a shortage. A careful study of the market conditions would be a benefit all round at the present time, we firmly believe. It would also be well to scan the advertisements of the honey-buyers who use our columns. It is needless to say we consider them reliable or their announcements would not appear in GLEANINGS. The largest buyers of honey in the world are now using these columns—a fact which speaks for itself as showing the desire of buyers to get in close touch with the actual producers. It is an acknowledgment, also, that the men who read GLEANINGS are not only large producers, but also turn out honey of the highest grade, for it is abundantly evident that the buyers can handle the highest grade of honey to much greater advantage than any other kind. We desire to see both producer and buyer prosper, and we hope, by presenting the true state of the market, to help both.

|           |                                                       |                         |

## A STORY WITH A MORAL

*By the Bee Crank*

Professor Bonnier, of the Institute of France, in a recent article states that the remarkable intelligence of bees in finding their way home is taken advantage of by a custom among the Indians. They discover a bee-tree in this way: They catch a bee which has alighted on a flower, and, having carried it some distance, let it go, carefully observing the direction it takes. A little further on they repeat the same thing with another bee. They are sure to find the tree at the point of the angle formed by the course taken by the bees, because it is a well-known fact that a bee will return to its home by the straightest line.

### MORAL.

If you will intercept a number of shipments of bee supplies, and note the direction from which they came, and draw straight lines on a map to represent these directions, you will find that nearly all of these lines

converge in Indianapolis. When a bee-keeper wants supplies he does not want them to reach him by a roundabout route; he prefers to have them come straight. Indianapolis is well called the "Pivot City," because it is the center from which radiate electric and steam railway lines to every point of the compass. This natural advantage has been improved by me by the adoption of every

business method which will insure prompt and careful packing and immediate shipments. I do not wait until orders are received before sending for a stock of goods with which to fill the orders, but carry at all times a full stock of Root's goods, which are sold at Root's prices, less five per cent for cash orders received during November.

**BEESWAX.** I have an outlet for a large quantity of beeswax, and I pay the highest market prices, 28 cts. cash or 30 cts. in trade delivered here.

My illustrated catalog of bee supplies is free.

## Walter S. Pouder,

**513-515 Massachusetts Avenue, Indianapolis, Ind.**

## THE YOUTH'S COMPANION.

This famous weekly magazine again makes its usual autumn announcement to the readers of GLEANINGS. It almost seems a superfluity to recommend this great paper to our readers, for everybody who makes any pretensions to being anybody has a good word to say for *The Youth's Companion*. It is a necessity in a family of boys and girls as much as a writing-desk or a piano. We can all well remember how we anxiously looked forward to the weekly visits of *The Youth's Companion*, and how disappointed we felt if for some reason it was not on time to the minute. To read it is to become a boy again, and there are many middle-aged people who do read it most assiduously, for its reading-matter is of the very highest order. The greatest writers of our age write for it and great statesmen, generals, ambassadors, doctors, travelers, and others equally eminent delight to contribute to its pages. We can not praise it too highly.

## "OFF FOR FLORIDA"—SEABOARD AIR LINE RAILWAY.

Some time during the month of November, Mrs. Root and I expect to "migrate" to Bradenton, Fla. In reply to the many kind friends who are making inquiries with the view of escaping our northern winters, I suggest taking the special trip ("the lowest rate ever offered") mentioned on the cover of this issue, by the Seaboard Air Line Railway. As a rule I would say, do not think of making an investment in real estate in Florida or anywhere else until you have gone and looked over the locality yourself.—A. I. R.

## BUYING A TYPEWRITER.

Elsewhere in these columns we print the very interesting advertisement of the Oliver Typewriter Co. This company recently decided to take the public into their confidence, and propose to sell their famous typewriters direct to the consumers on the easy-payment plan. This is one of the greatest concerns of the kind in existence, and, though relatively a very young firm, it has been phenomenally successful in selling its typewriters. It might be supposed from this that their machines are of a cheap kind. On the contrary, they make nothing that is not of the highest grade, and all the typewriters used in the offices of The A. I. Root Co. are Oliver's. This will serve to show our opinion of them better than words can express. They are in use by thousands of large commercial houses of the highest standard throughout this country, which we consider to be ample proof that the statements of the Oliver Typewriter Co. are well founded. In our opinion there is no better typewriter made than the Oliver.

## RHODES DOUBLE-CUT PRUNING-SHEARS.

One of the best farm tools we have ever seen is Rhodes' double-cut pruning-shears, made by a company of the same name in Grand Rapids, Mich. Anybody who has much heavy pruning to do would appreciate these shears very highly. The handles give a great leverage in cutting; but in addition they cut from both sides, which materially reduces the strength required to do the work. This method of cutting obviates bruising the bark as other shears do, and this is quite a feature with careful fruit-men who desire to give their trees the best treatment. Taking these valuable features into consideration we think many will find it profitable to enter into correspondence with the Rhodes Manufacturing Co. Their address is simply Grand Rapids, Mich.

## AN IMMENSE BUSINESS.

One of the sights of Kalamazoo, Mich., is the great plant of the Kalamazoo Stove Company. It is a monument to the enterprise and courage of its great promoter, Mr. Wm. Thompson, one of the wisest business men in the Wolverine State. To sell an immense output of stoves, ranges, and heaters by mail is no small task which would entitle the manager to very great fame, but also to superintend every detail of manufacture as well, is something of an achievement such as few men can claim the credit of.

There is, however, a considerable advantage in working along this line. The stove manufacturer comes into closer touch with the consumers, for thousands of letters reach him every day during the busy period of the year. He knows exactly what is wanted. He requires no army of expensive traveling salesmen to get orders. Neither are stores and warehouses in the cities and towns required. It is a simple system. All middlemen are cut out completely, and producer and consumer do business without the intervention of an agent who would want a greater profit than the maker of the stove. This is quite an achievement to say the least.

It goes without saying, that Mr. Thompson, the manager of the Kalamazoo Stove Co., is a man of unfinching integrity or he could never have built up this immense business. Of course, he believes in the square-deal principle, without which no great mail-order business can long exist. It is almost needless to add that this company tries to make a friend of every purchaser of a stove, for in this way they are able to sell several stoves right in the same locality, and will keep on selling as long as mankind requires stoves.

If you have it in mind to purchase a stove, it would be a good thing to write for a copy of their catalog. The complete address and advertisement is on the cover.

# A COMPARISON: First and Third Places in List of Ten Papers.

Of course, we were gratified to read the letter below, coming to us unsolicited, and we know our readers will be pleased too, for it is by their kindness in patronizing our advertisers that such favorable showings are made for us.

## "Practice Makes Perfect."

A little girl sat on her father's lap, looking into the mirror, and inquired if God made both her father and herself. Being assured that he did she remarked that he was doing better work than he ever did before.

It is simply the old adage over again, and it is true of *The A. I. Root Co.'s* Bee-keeping Supplies; and while perfection can never be attained they are as near perfection as improved machinery and years of practice can well make them. If you have never seen them, or if you have, and have not a catalog, send at once for my 40-page catalog, illustrated profusely, and giving prices of every thing used in the apiary. *It is free for the asking.* Special price list of shipping-cases, and all kinds of honey-packages—wood, tin, and glass. Send a list of what you will need at any time and let us tell you what they will cost you delivered at your station.

*Cash or goods, for wax at all times.*

# What Would You Do?

## If Your Hens Stopped Laying? If Your Horse Got the Colic? If Your Best Cows Were Ailing?

These are but a few of a thousand problems that may arise any day and cause you loss, trouble, and expense. Do you know how to solve them all? Jacob Biggle tells you in his handy Farm Library, and gives you, besides, a host of other useful facts and pointers that every person on the farm should know. His books—ten in all—are a treasury of reliable information based on practical, every-day experience, not on theory. Each of the books covers its subject exhaustively—authoritatively—and is written in a delightfully readable and interesting style. Jacob Biggle has for 30 years been a constant contributor to the Farm Journal, and, like this best-liked, most widely read American Farm Paper, his books are concise, comprehensive, up-to-date, profusely illustrated, four of them with handsome colored plates.

**The Horse Book** covers the subject thoroughly—health and disease, history, training, care. 55,000 copies sold. It will put you right on the sheep question.

**The Sheep Book** tells which breeds are most profitable, etc. It will put you right on the sheep question.

**The Poultry Book** is tremendously popular—by far the best handbook for the farmer's flock. Sixth edition. Sixteen colored plates.

**The Cow Book** tells how to make dairying pay; full of cow wisdom; condensed, and accurate. Don't wait until the cow is sick.

**The Swine Book**—breeding, feeding, fattening, and

marketing, with chapters on the diseases. The whole story.

**The Orchard Book** is crowded with new fruit facts and fine illustrations. By an expert. Twenty fine colored plates.

**The Garden Book** tells how the author made money in the business—a remarkable record.

The other books are like these—stuffed to bursting with facts, advice, and practical ideas.

**The Berry, Pet, and Health Books** are fine, every one. Each book is a handy size to slip into the pocket and consult during day's work. They cost only 50 cents per volume, postpaid; \$5.00 for the set of ten.

## OUR SPECIAL OFFER

The regular price of the Biggle Books is 50 cents each, \$5.00 for the complete library. The subscription price to the Farm Journal is 75 cents for five years. For a limited time you can get one of these books and a five-years' subscription to the Farm Journal for \$1, also an opportunity to secure the other nine volumes of the Biggle Library—Free of Charge.

**THE FARM JOURNAL** contains more helpful money-making suggestions for the farmer and his family than any other farm paper published. That is why it has so many readers—more than any other farm paper in America, and more than all other farm papers of foreign countries combined.

Mrs. Ollie C. Krieder, of Jamestown, Pa., wrote us that the information secured from the Farm Journal helped her to make clear in cash \$137.

Thousands of our subscribers voluntarily write and tell us how they have made money from reading the Farm Journal. Following are a few of the bright, timely, and interesting articles that will help our readers get more profit and pleasure out of their farm this year. These all appear in the November issue, but every other issue is equally full of good things.

*High Farming at Elmwood—Saving the Potato Crop. Money in Hogs—How to Get it Out of Them. The Farm Horse in Cold Weather. Raising Pigeons for Profit. Law for the Farm. Troublesome Insects—The Way to Deal With Them. Keeping Farm Accounts. A Woman Luther Burbank. Farmer's Problems—How to Solve Them. How to be Happy Though Unmarried—Prize Article. Family Doctor—Report of Tuberculosis Congress. Diversions for Young Folks—Games.*

## Let Us Send You a Biggle Book on Approval

The Farm Journal will be worth as much to you as it is to 550,000 other subscribers. In order to prove it we will send you on approval any one of the ten Biggle volumes and a sample copy of the Farm Journal.

If, after you have looked them over carefully you don't honestly feel that a visit from the Farm Journal every month for five years and one of these handy volumes is the biggest dollar's worth you ever saw, send the book right back and we will return the postage, if you wish.

If you think it is a good offer—and 999 out of every 1000 do—send us \$1.00, keep the book, and we will enter your subscription to the Farm Journal for five long years.

### DO NOT DELAY

Problems are arising every day that the Farm Journal and these books will help you solve and thus earn their cost many times over. Don't send us any money; just fill out the coupon in the lower left-hand corner and send it in to-day. We will send the Biggle Book and the sample copy of the Farm Journal on approval, and, furthermore, we will tell you how

## STRAY STRAWS

DR. C. C. MILLER

BEE-KEEPING is mentioned, p. 1279, as "probably the oldest human occupation under the sun." I wonder, now. Adam was a gardener. Did he "probably" spend some time at bee-keeping before he began gardening?

MY GRANDSON, 11 weeks old, is now here on a visit from Washington, D. C. When I realize what interest is awakened by that single lump of humanity, I wonder how it can be with A. I. Root with his full outfit of grandchildren, assorted sizes.

"WOULDN'T it be fair for the buyer of honey to allow the producer half price on the can?" asks Dr. Lyon, p. 1245. Isn't the answer on the next page, where the editor says, "He pays the producer half a cent more per pound for the honey because it is in tins?" [Y-e-s; but after all we suspect that would not quite answer Dr. Lyon.—ED.]

FOR UNCAPPING, there is suggested, page 1244, "a straight-handled tool on plain work, and another knife, with an offset handle, in places which can not be reached with the straight knife." Are not those "places" depressions, and would they not be better reached with a straight handle and a curved blade? [Quite likely. Who knows by experience?—ED.]

UNCLE JOE CANNON denounced by the Rock River Methodist conference for opposing temperance legislation, p. 1274. Oh, my! that's not the only pebble on the beach. Can't recall them all; but there are other Methodist conferences doing the same thing; also the Methodist bishops (isn't the M. E. General Conference also on the list?) besides Baptist bodies, Quaker—oh! I don't know what all. Fact is, moral issues are forcing politics into the church, and the leaders are beginning to use plain talk.

FORMIC ACID, according to that quotation from U. S. Bulletin 110, page 1254, "is supposed to be introduced into the honey by the bee just previous to capping the cell." Why not add that the bee drops it into the cell from its sting? But does any intelligent bee-keeper nowadays believe that the acid is added "just previous to capping the cell"? [You seem to have in mind the old sting-trowel theory, long since exploded and discarded. Why can not the bees introduce the formic acid in some other way than with their stings? The author of the bulletin mentioned, we do not think, had in mind the sting-trowel theory.—ED.]

THAT POINT that W. K. Morrison makes, p. 1248, as to the dryness of honey compared with other foods, is good. It struck me almost as something new. But I would not like to insist before a promiscuous audience that "Actually, honey improves with age." Put in that general form I'm sure it would be met with the answer, "I know that isn't true, for 'new honey' is always best, and the longer we keep it the poorer it gets." Even if, under proper conditions, it may improve with age, there's a limit, I think, to that age.

A NUCLEUS with the full two-inch space under bottom-bars had become so strong that the cluster of bees hung an inch below bottom-bars. On a hot day I lay for some time on the ground in front of the hive watching the bees enter. They had no fixed rule. Some lit directly on the cluster, some on the floor, and some on the side of the bottom-board. Then I watched the bees flying out. Some started directly from the cluster, and some jumped down on the floor and walked out. [We have watched the bees in the same way, and found they fly out and return exactly as you describe.—ED.]

GLAD TO SATISFY the curiosity you express, Mr Editor, p. 1243. I had 129 colonies, spring count, from which I took 19,480 sections. Although that's short of what I expected, it's better than I could have done 25 years ago. -Probably three reasons for the improvement: Forage better; bees better; bee-keeper better. [This is 151 sections of comb honey to the colony. As you use  $1\frac{1}{2}$  by  $4\frac{1}{4}$  square sections this would make a little less than 140 lbs. of comb honey per hive. The record, while not a breaker, is good for that number, and you are to be congratulated. While the season was excellent we must give the man and his management some credit.—ED.]

"FOR OUTDOOR-WINTERED colonies we recommend about 25 lbs. of sealed stores," page 1245. While that may be all right at Medina, I'd feel safer here with 30. And a good way south of Medina, don't bees use more? [Where it is very cold the bees will consume more stores than where it is only moderately so. If the other extreme is reached, where the bees can fly almost every day in the winter, then there will also be a larger consumption, but at an increased ratio. In our locality we would estimate that there would be less stores consumed than in any point north or south of us. If 30 lbs. would be about right for Marengo, then 25 lbs. would be a safe figure for a locality somewhat milder.—ED.]

W. M. JANES wants me to give some of the most easily seen points in appearance by which I can decide that a queen is old. I can recognize

John Smith at a glance; but to tell you just how I recognize him so that from my description alone you can recognize him at a glance, is probably beyond me. In the same way it is easy to recognize an old queen, but not so easy to tell how. And yet it's a fair question, so I'll make a stagger at an answer. An old queen is darker and more shiny in appearance, due to loss of plumage, probably. She does not move over the comb with the vigor of a younger queen, but more slowly and feebly. In many cases she seems to lose her footing, and acts as if about to fall off the comb. Now, that doesn't seem to tell much, but I'm not sure I can do any better. I'll be glad, Mr. Editor, if you or any one else will improve upon it. It is only fair to say that even the few signs I have given are not infallible. A queen that has been balled may look black and shiny while still young. Again, I have seen a queen which looked not very old, and yet my record told me she was three or four years old. [You have given the general characteristics that go to show an old queen; but there is a certain indescribable *general* appearance which is at once recognized by the veteran queen-breeder, and which to him is almost infallible.—Ed.]

## EDITORIAL

By E. R. ROOT.

### THE DETROIT-CONVENTION PICTURE.

ELSEWHERE a picture taken of the members who were in attendance at the National convention at Detroit is advertised by Secretary Hutchinson. We have seen this, and unhesitatingly pronounce it by all odds the best photo of a collection of representative bee-keepers we have ever seen. Every face is clear and distinct, and, what is more, shows a natural likeness. It is 18×22, and can not be reproduced in half-tone on the pages of any of the bee-papers. It will probably be many years before another collection of as many representative bee-keepers as are in this one will be seen again.

### THE FOREST FIRES OF NORTHERN MICHIGAN.

We have just received word from Mr. Geo. E. Hilton, of Fremont, Michigan, stating that "the forest fires are making sad havoc in the bee industry of this State. To-day's papers state that over fifty dead bodies have been found, and scores are yet to be accounted for." This will mean, of course, the absolute destruction of all bee flora within the territory involved, as vegetation of every kind will be destroyed, root and branch. The sympathies of all bee-keepers will, we feel sure, go out to those who have suffered from this terrible affliction.

### THE PAPER PLAN OF UNITING BEES.

AFTER reading our editorial on page 1178, Oct. 1st, setting forth the various methods of uniting bees, several write us, saying we had omitted one very important plan—namely, putting a sheet of

newspaper between the upper and lower stories of the two forces to be united. Several of these writers pronounce the paper scheme far ahead of any other method, because the bees will gradually unite after gnawing through the paper, and because they will not return to their old stand.

We remember that this paper scheme has been given before in our columns; but at the time of preparing the editorial mentioned we had forgotten it.

### PHOTOGRAPHS OF APIARIES FOR ILLUSTRATED WORK FOR GLEANINGS.

WE are getting a large number of snapshots of bee-yards that we can not use. A mere picture of an apiary, showing a collection of hives of *ordinary* pattern, with *ordinary* surroundings, does not convey any new information; nor does it illustrate any trick of the trade. Photos that we use must contain some distinctive feature. Those that show methods of work in handling bees or hives, are, as a general rule, very acceptable, for these convey an object-lesson that the reader can take in at a mere glance. A view of a bee-yard with a pretty background, or one with hives artistically arranged is also acceptable, because it stimulates the artistic sense in one's nature; and when it costs no more to have the surroundings neat and pretty, others are inspired to beautify their apiaries. Photos of prominent bee-keepers or of scientific subjects, or of practical appliances are always available.

In a word, any photo that we use must contain some distinctive feature that is either artistic or educational. They must in some way carry a message of some sort. For example, in the Aug. 1st issue the half-tone plate on p. 942 shows an apiary with good tiering up of the hives that are home-made; page 943 shows how just enough shade may be secured from a shed; page 944 depicts excessive clustering out on a hot day, and proves that some very good shade-boards did not serve to stop it; 945 represents a yard, not artistically arranged, but that has yielded a good revenue to its owner, and, incidentally, a hive-carrying wheelbarrow is shown in the background. So on, each picture will have some feature that makes it available for these columns.

### QUEENS STOP LAYING IN THE FALL.

ON the approach of fall every year we have to answer many inquiries from beginners as to why their queens do not lay and have not laid since along in August. For the benefit of such we will repeat that, as a rule, Italian queens, at least, will stop laying after the main honey harvest in August in the Northern States. They may begin laying again if there is a fall flow; but as soon as it stops there will be no eggs and but very little brood, which will be mostly in the sealed form. The reason of this is, the queen and the bees are slow to rear brood when there are no new stores coming in, either from the fields or from a feeder. If the colony is not strong it is always advisable to practice stimulative feeding early in the fall so there will be a large force of young bees to go into winter quarters. About the time this journal reaches most of our readers it will be too late to practice this.

In such cases the colonies, if weak, should be united with the others according to any one of the methods mentioned on page 1178 of our issue for Oct. 1.

#### HOW TO CONTROL THE RAVAGES OF FOUL BROOD IN STATES WHERE THERE ARE NO FOUL-BROOD LAWS; THE VALUE OF DIPLOMACY.

The question is often asked what to do when foul brood is in one's locality, and there is no State legislation covering that disease. Where one has considerable invested in bees in any such State, he can not afford to allow the disease to exist within a few miles of his locality. Indeed, he can better afford to inspect all bees within ten miles of him, and administer cures, if need be, at his own expense. The only thing to do in a case of this kind is to use diplomacy and moral suasion. Good bee-inspectors tell us that they rarely have to bring the law to bear on any recalcitrant bee-keeper. If an inspector is made of the right stuff he can generally get along without any trouble, and the same is true of the bee-keeper without a law back of him. All he needs to do is to cultivate the acquaintance of all bee-keepers within ten miles of his apiary. If there are many of them, let him call together a bee-convention to discuss methods of management, prices of honey, and last, but not least, bee diseases and their cure. After getting them together in a friendly way it is very easy to volunteer assistance.

But suppose there are only one or two bee-keepers in the locality. Take a horse and buggy, and on arriving at, we will say, Mr. Jones' home, address him something after this fashion:

"Mr. Jones, I am a bee-keeper at Blankville. I understand that you have been having a little difficulty with some disease or malady among your bees. Thinking that I might be able to help you, I drove over this morning. I should be glad to examine your bees; and if you have what is known as foul brood I will cure it for you free of charge." If he receives you kindly your task is easy.

In the back end of the buggy should be extra frames of foundation; and if Mr. Jones is the right kind of person he will be willing to pay the cost of them. If he is a little "offish," give him the frames outright, on condition that he will permit you to burn the combs and the brood.

In all cases of this kind, make careful inquiry of all these Mr. Joneses to ascertain whether they are hard to get along with. If they are of the other sort, get some one who is a good friend of both of you to go with you.

We will guarantee that, in ninety-nine cases out of a hundred, if you use the right kind of diplomacy you will be able to banish the disease from your locality, and it will not cost you nearly as much as to spend several days at the State House trying to get the members of the legislature to pass a foul-brood bill. While every State *should* have a foul-brood law, one can not afford to allow the disease to exist in his locality in the absence of such law without making some intelligent effort to combat it. If there is no law, there is no legal way in which one can compel a bee-keeper to treat foul brood if he has it. He must coax him into it by showing him that it is to *his* interest to cure it.

#### THE DETROIT CONVENTION.

THE meeting of the National Bee-keepers' Association at Detroit, Oct. 13—15, was a success in every way. It was estimated there were between 300 and 400 in attendance. Bee-keepers came from the east, north, south, and west, and from Canada. There was not only a big attendance, but a large number of representative bee-keepers, well known either from their writings or because of their large interests in bees and bee-keeping. Detroit has well earned the reputation of being an ideal city for a convention of bee-keepers.

The convention was held in a large hall—in fact, it was *too* large to enjoy the best acoustic properties. Unfortunately some carpenters were at work on the building, and at some of the sessions the sound of hammers made hearing difficult if not impossible. When it became intolerable the members were allowed to retire to an adjoining hall in the rear. But even there the carpenters could be heard.

This convention was remarkable in another way, in that there was no bitterness or personalities indulged in, either on the floor or between sessions. Every one, apparently, came with the view of receiving and imparting.

There were many exhibits, and a number of good prizes carried off. The program, which was most carefully prepared by Secretary Hutchinson, came off with very little hitch.

In our next issue we hope to give one or two of the papers, and in the mean time we present here a report of one of the sessions by A. I. Root, who was present.

#### "TURNING WINTER LOSSES INTO PROFIT;" ALSO HOW TO FREE A LOCALITY FROM DISEASE.

TAKING it for granted that our readers will, at least the greater part of them, have access to the stenographer's report of the National convention at Detroit, I will not attempt to give a write-up. Perhaps I ought to add, however, that I do not think I ever before met so many people who wanted to shake hands with your humble servant. If I attended the different sessions of the convention, and avoided talking while some speaker occupied the floor, it was about all I could possibly do to shake hands and make each one tell his name and address. In that way I could locate and identify many of them. A dozen times or more I said to myself, "I must go back and hunt up that dear brother or sister, and have a talk." My name was called by many voices at the close of the first evening session; but as it was already bedtime, I decided to give my little talk the following day; but the program was so full, and the speakers were so able, that there did not seem to be any chance for me to return even a friendly greeting. I hope the women-folks especially will accept my apology for replying so briefly to their many kind words of appreciation—especially the expressions, accompanied by a pleasant look, in regard to the Home papers. I am going to try hard to keep well and to live long for the sake of the wives and mothers if for no other reason.

The marked event of the convention (to me) was the address of W. J. Manley, of Sandusky, Michigan. The subject was the title of this article—"Turning Winter Losses into Profit." By

the way, friend Manley is not only a comical genius, but he is a first-class humorist. It would not do to say that he held his audience "spell-bound," for, on the contrary, they were hooting and yelling a good deal of the time at some of his sallies of merriment and huge jokes. In fact, had not the good president gently told him that he really *must* stick to his subject I fear he might have occupied nearly the whole forenoon with his queer speeches and antics. When he first started out I feared he was not going to be able to handle his subject; but, oh dear me! what a revelation when he "got down to business!" It was worth the whole trip there to see him and to hear his talk; and yet both Ernest and Huber missed it entirely. They were both continually called on to explain about the large display of implements and other things connected with bee culture. By the way, this exhibition of bee-keepers' supplies ought to be in a room by itself; and the president should lock this room up during the hours of the convention—at least it looks that way to me.

Mr. Manley said there were many winter losses in his locality. When questioned closely he said he thought it was likely owing, to a great extent, to the aster honey that is gathered clear up till freezing weather. This honey is unsealed, and, of course, not ripened. It gives the bees dysentery, and in many apiaries the bees are all dead by the time blossoms open in the spring in his locality. He said he thought it very likely that taking this poor honey away and giving some stores of sugar syrup would save the bees. But how are you going to make them take the sugar syrup when there is honey to be had in the fields? He said he thought it very probable that taking away all combs outside of the cluster containing unsealed stores, and replacing them with combs of good sealed honey, or, better still, sugar syrup fed and sealed up early in the season, would make a success of wintering. But this was a good deal of trouble, and many found it very much "easier" to let the bees take care of themselves; so that, year after year, when spring-time came, there were hives of dead bees all over the land.

One spring a few years ago he told his wife he did not believe there were live bees in a dozen hives, out of a hundred or more that were covered up with snow. When somebody asked why he did not put them in an up-to-date bee-cellar I can not remember exactly what his reply was; but I think it was to the effect that, in his locality, where bees *can* winter outdoors they are generally ahead of those wintered in the cellar. Well, last spring he told his wife that a hundred colonies or more were dead. She was bright enough and wise enough to suggest that it did not matter very much any way, as it would give them a good chance to start over again with things in better shape; and in due time he and his wife went to work to get the wax and honey out of those empty hives. The combs were mostly old and heavy, and he got so much wax out of them that they had one of their "happy surprises." The honey was also saved, and sold to good advantage. If I remember correctly, some of it went to the baker's. But his greatest success came by changing his whole apiary over into modern hives with the bees all on frames of

wired foundation. The advantage of working with new up-to-date implements compensated, or more than that, for the value of the bees that died. Of course, this change might have been made with bees that did not die; but had they all lived they probably would have worked along in the old-fashioned way.

Well, after friend Manley and his wife had really gotten into the business he thought he would see how low he could buy the hives and combs of his neighbors where the bees had died. He found them generally glad to have them take the things off their hands at his own figures; and he finally scoured the whole country, gathering up the hives that would probably breed moth-millers or perhaps, in some localities, foul brood. By the way, friend Manley's scheme of clearing up the remnants of "blasted hopes" throughout the country all roundabout is one of the best remedies, both in the way of prevention and cure of foul brood, and he made money by it too. And his neighbors *also* made money. He said they were always glad to see him, because he took a disagreeable job off their hands. I have not the figures in dollars and cents that he gave us; but when you come to see them you will be astonished.

Now, here is a point that was brought out by his talk: He suggests, if I have it right, that it would pay any bee-keeper to melt up his combs, especially the brood-combs, every four or five years, and fill the frames with new sheets of wired foundation. If there has ever been any foul brood in the region the frames and hives should be treated in boiling water to banish effectually all traces of the contagious disease.

A report of friend Manley's plan of getting out the wax will be found on page 1313 of this issue; however, as this article was written some time ago, we think friend Manley will give us something for our pages that will bring the matter fully up to date.

I do not know of any subject of more importance to bee-keepers than this very thing that friend Manley has opened up to us. Old, dilapidated, run-down apiaries are a curse to any community or neighborhood; and friend Manley goes about through all his region doing missionary work in "gathering up the fragments that nothing may be lost." The man who has sold out every thing clean, and gotten rid of his old traps, will be very much more likely to start anew with nice up-to-date fixtures than he would if the old traps were left lying around loose. By the way, would it not be a fine thing if some such missionary would go around and buy up the old implements and other truck lying around in the corners to disfigure many farm homes? Years ago T. B. Terry astonished the people of Northern Ohio by having every thing unsightly cleared away from around his home and even from around the barn; and I did not understand how he did it until one day when I went over the hill back of his house. Every thing unsightly was carried off to a sort of "boneyard" back of the hill. Friend Manley has been doing for bee culture exactly what Terry did for the average farm home. The *women*-folks will enter into this work most heartily. In fact, Mrs. Root will hardly let me go to sleep nights with unsightly rubbish left around in sight, especially in the front yard.—A. I. R.

## CONVERSATIONS WITH DOOLITTLE

PLURALITY OF QUEENS; WHEN PROFITABLE AND WHEN NOT.

"I have been reading Mr. Alexander's article on page 1135 of the September 15th number of GLEANINGS, and I wish Mr. Doolittle would tell us in his department just what he thinks or knows of this matter.—SUBSCRIBER."

I have tried the plural-queen system extensively, though my experiments have doubtless been fewer than those of some others. All through these discussions of the past I have looked for *one* thought in that connection which interests those in the white-clover belt above any thing else; and that is, "Can this plurality of queens be made profitable to us who desire all the surplus from the white clover possible?" So far it has been but meagerly touched upon, and that in only an indefinite way, no one having given figures to show that two or more queens in a hive prior to the blossoming of the clover are of profit. In the absence of these I wish to give a little experience of my own in this matter. I have often had a mother and daughter under supersedure circumstances in one hive during the basswood flow or later; but one spring, soon after setting the bees from the cellar, I found two fine queens in one of my strongest colonies. A scientist offered me \$25.00 for this colony, but I would not part with it, as I wished to see what I could make from it, believing that these two queens would give me double the bees for the harvest that one could. The next time I looked into the hive I found many cells occupied with two and three eggs, just as we often find in small colonies having a queen capable of laying more eggs than the bees can cover, or bring to maturity early in the year. This convinced me, as have other trials since, that, unless I double up the colonies so as to get bees enough to mature all the eggs two queens can lay early in the season, there is no more advantage with the two queens than with one, so far as securing workers for the early harvest of white clover is concerned; for, as a rule, any one of my queens will produce all the eggs that the bees can mature to be of advantage in the white-clover honey harvest. We must bear in mind that, when any colony is in a normal condition, it takes 37 days from the time the egg is deposited in the cell by the queen before the bee coming from that egg enters the fields as a laborer; and as the white clover comes into bloom about June 15 in this locality, the eggs for our laborers in that harvest must be deposited in the cells from May 5 to 12. Now, up to May 15 even an average of my queens can and do lay all the eggs that the bees of their colonies can cover and mature; hence, to go through with the work of introducing two or more queens to any colony prior to this date would be altogether unprofitable and useless, to say the least.

Let us now go back to the two-queen colony. It appears that the queen laid at least one-third more eggs than the bees could mature prior to May 15; but after that time the bees began to cover more and more of the eggs and mature them, so that about June 1 to 10 the hive was

completely filled with brood. However, as this brood developed into bees during the period of partial or complete dearth which we have upon the waning of the clover, just before the opening of basswood, these bees became consumers of the honey already gathered, rather than producers, and therefore did not add to the crop of clover honey. In other words, it took honey from the colony to produce them, and then again to keep them alive after the honey harvest from clover was past, so they were not a profitable investment with the exception of those that lived only into the basswood bloom. And even then this colony gave no greater yield from basswood than did others which had only one good queen. In looking up the history of the larger share of those who are championing the plural-queen system I find that the majority of them are interested in the fall crop of honey more than any other; and to such as these, where a plurality of queens can be successfully worked so as to bring a *great army* of bees on the field of action just when the thousands of acres of buckwheat or other late honey-producing flora are at their perfection, there can be no doubt about the practicability of the plan. But from all of my experience in this matter *one good queen* will lay all the eggs that the bees can brood so that the bees from these eggs will be of advantage in the *white-clover* harvest.

But I hear Dr. Miller saying, "I am all interest in this matter because the bees do not swarm with two or more queens in one colony." But, doctor, this colony *did* swarm; and not only this one, but enough of others which were used with two queens, separated with queen-excluding metal, to make me see that the non-swarming part of it can not be depended upon. Over half of the colonies used with two queens have swarmed; but I will acknowledge that swarming seemed to be delayed to quite an extent; and when delayed long enough so that the honey-flow began to wane, such colonies did not swarm, just as colonies having only one queen do not swarm when, for any reason, they are delayed till the honey harvest is nearly over.

Then I hear another one say, "By the use of perforated metal we can keep two queens over winter in one colony, so that we can have queens to replace any poor ones in the spring, give to queenless colonies, or to sell, so that here is a profitable part of this plural-queen system." I really hope he is right, and that others may prove it so, for this would be something of great value to the queen-breeder in our Northern States; but my experience all points to the fact that, *as a rule*, only *one* queen remains in any colony when spring opens up. The colony alluded to, having the two queens when set from the cellar, is the only colony which I ever knew that had two good laying queens to begin the season with, no matter whether perforated zinc was used or not. To be sure, two queens can be wintered in one hive, the same having a thin partition of wood or some other thin substance to divide the bees into two separate colonies, but such can hardly be said to be along the line of the plural-queen system. After finding the two queens in one colony I thought I could have two queens in as many colonies as I desired in early spring; but in this I have only failure to record.

But the most serious part of this whole matter is that the majority of our every-day practical bee-keepers do not seem to succeed in keeping two queens (to say nothing about several) in any colony for any length of time, at any time of the year, except on certain occasions, and those occasions do not come oftener than once in three or four years. I have read over and over the third, fourth, and fifth paragraphs in Mr. Alexander's article on page 1135, in which he set forth the ease and certainty of this plural system, and asked myself the question, "What is the reason that Doolittle and others do not find the thing a success as Alexander did?" As a rule, the first thing the bees in the upper story do is to persecute the queen which we desire they shall consider on the same terms they do the one in the lower hive. I have not only used one excluder, but two and three, these latter being separated from one-half to one inch apart; but nineteen out of every twenty queens so tried are killed or balled, and persecuted till they are of no value. This plan would be most valuable for making nuclei could it prove in the hands of the rank and file a thing of ease and certainty. At the time "Scientific Queen-rearing" was published I thought it was no trick at all to get queens fertilized from upper stories with laying queens in the hives below, as I succeeded to my perfect satisfaction during the basswood flow of 1888; but twenty years of trial since then has proven that I have to record nineteen failures to one of success, taking the score of years together. The many private letters I receive also show that I am not alone in these failures.

---

## NOTES FROM CANADA

By R. F. HOLTERMANN.

---

In the *Bee-keepers' Review* for October, page 304, a writer whose name is not given, but whose letter is well worth reproducing, makes the following statement in regard to shade for hives:

"Again, it has been said by some one that bees were better with hives right out in the sun. Some of our hives stand in the sun; some have shade part of the time, and some shade all the time. Now as to present results: Some of the hives that are in the shade all the time show the best yields of honey."

The above is my experience. If it can be arranged, sun in late spring and autumn is all right; but I can get the best results by having the hives shaded during the swarming season.

In regard to Italian bees, this same writer says:

"Have you not said a good deal in favor of the 'Superior' stock? My apiary here was originally all black, the kind that I don't like—little nervous devils that are so hard to handle. Two years ago I introduced queens from Moore and Laws. This spring the yard would run about half and half. We have had a very good crop of white-clover honey, and we tiered up until near the end of the flow. Now, as we go through the yard we should expect the Italian stocks to show some superiority in amount of honey stored; but they don't. Some of the biggest stacks are

on the pure black colonies. However, I am killing the black bees off as fast as I can."

To these remarks editor Hutchinson adds the following, which my experience confirms in the fullest manner when comparing black and Italian bees:

"I have known for a long time that, in a good honey-flow near home, as is often the case in white clover, no strain or variety of bees can surpass the pure blacks; and when the harvest begins to wane, when the nectar must be sought for far and wide, then the Italians hang on while the blacks do practically nothing; all things considered, the Italians seem to be the best bees for this country."

I am rooming here at the National convention at Detroit with Mr. W. D. Wright, one of the New York State Inspectors of Apiaries. Wide experience has taught Mr. Wright that, where disease is at all prevalent, it is better to have Italian bees. I have noticed far more ordinary dead brood in black colonies than in the Italian or Carniolan; in fact, such is rare with Italian or Carniolan bees.

The attendance of Canadians at the National convention is excellent—probably greater than at any previous convention of the organization, and the attendance of all at the opening session is, I believe, greater than at any in its history, and so said George E. Hilton, the president, in his opening remarks.

### CAN A SWARM TRAVEL LONG DISTANCES?

I recently met two fishermen who related to me an incident of great apicultural interest. These men stated, and there is abundant evidence to corroborate it, that, while sailing on Lake Erie, a large swarm of bees was seen coming from the North. The swarm passed the searchlight some three miles from Erie city, and landed at that place, where it was hived and is now located. I was asked where the bees came from, and I unhesitatingly stated, as had others, that they must have started from the Canadian shore of Lake Erie, traveling right across the lake. Granting that the bees came from the extreme end of Long Point, they would have to travel 46 miles over water. Bees would never leave the United States shore to travel out a distance and then return, as they would have to do in case they came from the United States; and a bee-line or any thing like it from Erie to the searchlight, and then continued, would lead to the Canadian shore.

I recently related the above to Jas. Armstrong, Cheapside, and he told me the following incident:

Some thirty-three years ago a man by the name of E. Harrison, township of Walpole, county of Haldemand, Ontario, cut a tree on Peacock Point, which runs out into Lake Erie, and the tree contained a colony of fine Italian bees. At that time there were no Italian bees in the district that either Mr. Harrison or Mr. Armstrong knew of, and both gentlemen believed that this swarm had crossed the lake from the United States—a distance of over 50 miles. It is rather singular that two such facts should come under a bee-keeper's notice within a few weeks; and, being so reliable, they are well worth recording in apicultural history, and they pretty well prove that a swarm can travel a long distance.

## GLEANINGS FROM OUR EXCHANGES

By W. K. MORRISON

### BLUEING IN BEET SUGARS.

Bee-keepers will read with peculiar interest the following excerpt from the October issue of a recognized authority on the subject of beet sugar:

Most manufacturers who resort to blueing of sugars use ultramarine blue for the purpose. Of late it has been proposed that indathrene be used instead. It is claimed that it has all the advantages and none of the disadvantages of the ultramarine blue, which frequently decomposes with the production of sulphureted hydrogen. When the sugar is heated and contains traces of acid, it may be said that this chemical action is a great disadvantage, as certain jam manufacturers refuse to use blueed sugar in the preparation of their products. The indathrene blue contains no sulphur and undergoes no change, even when boiled with acid syrups. Alkalies are without action on this product. It is claimed that blueed indathrene sugars have excellent keeping powers and resist all action of light and moisture. It has been apparently demonstrated that no physical harm can possibly be derived from eating sugars blueed with indathrene.—*The Sugar Beet*.

### FRUIT-TREES FOR HONEY.

Most of the northern fruit-trees are good for bees; but this is not so true of the tropics, where some of the leading fruits are unnoticed by bees. This is true of bread-fruit, sour-sop, cherimoyer, sugar-apple, pineapple, mangosteen, durian, and some others of less value. On the other hand, some equally important are honey-yielders. For example, the mango, which is the apple of the tropics, yields some honey, as also the banana family. That exquisite fruit, the avocado, is a fair yielder, and so are star-apple, saponilla, golden apple, Malacca apple, guava, rose-apple, and a number of others not so well known. The coconut yields well, and nutmegs supply nectar every day in the year. The date is a heavy yielder. A well-known wild fruit, the hog-plum (*Spondias lutea*), yields heavily for five or six weeks. Coffee and tea are both honey-plants, but cacao, or chocolate, is indifferent.

### BEES PUNCTURING FRUIT.

Mr. Peirce, the bee-man of Zanesville, O., has had an experience the past summer which tries men's souls. One of the local papers made the statement that grape-growers in a certain section of the city were having their grapes destroyed by the attacks of bees. It was not difficult to tell whose bees were meant. Mr. Peirce replied to this in a rival newspaper belonging to a different political party. He showed that bees notice only injured fruit, and that, so far as bees being a menace was concerned, the opposite was the case, since they are the chief agents in fertilizing the blossoms. He followed up this argument by stating that the courts have repeatedly upheld the bee-keeper when his right to do business was attacked. The latter was delivered as a sort of clinching argument. In any event, he has heard nothing since.

But we must be careful, for this is an age when everything is "regulated." It is a good thing to keep the soft side of the local editor.

### L'ABEILLE ET LA RUCHE.

Mr. Dadant has gotten out a new edition of the above work. Of course, most of my readers

will understand that it is the revised version of Langstroth's great book, "The Hive and the Honey-bee," written in the language of France. It looks very much like the English edition in every respect, except that it seems a little better executed as regards paper, printing, and binding. The publisher is Burkhardt, of Geneva, Switzerland. So far as I can see by a rapid examination, the translation is as accurate as it can possibly be. The book is so well known to bee-keepers all over the world that to praise it would be a work of supererogation. In French Canada, Louisiana, the West Indies, and elsewhere on this side of the Atlantic, "L'Abeille et la Ruche" should have a large sale among bee-keepers. It is a complete guide to bee-keeping, written by two great masters in bee culture—accurate, scientific, and up to date. It is sold at a very reasonable price, so that French-speaking bee-keepers have no excuse for not owning a copy.

### FOOD VALUE OF SUGAR AND HONEY.

There is a widespread idea that sugar is only a condiment and not a food. It is very difficult to combat such fallacies, as they are ingrained and form part of the personal character. The latest authority to try to stem the torrent of public opinion is Prof. Landouzy, dean of the medical faculty of the University of Paris, whose opinions on the subject are being given wide publicity by the newspaper press, both here and on the continent of Europe. He says sugar is not a condiment, and recommends it for the army as a strength-producer, as it has the advantage of being used up by the system almost instantly. Laboring men are advised to use it as a food, not merely as a condiment in tea and coffee. Of course, what he says applies with double force with regard to honey, as it stands ahead of sugar in the rapidity and ease with which it is used up by the human system. Formerly we were taught that the carbohydrates are useful only as heat-producers. The new school has thrown away that idea. In the next war the soldiers will make forced marches on a diet of chocolate creams made of honey, chocolate, and sugar.

### PARCELS POST MISREPRESENTED.

An editorial in *The Shoe and Leather Gazette*, opposing parcels post, is being widely published by the papers favoring the present system. It is a gross misrepresentation. It says: "The uniform rate would not work equitably. It would enable a big manufacturing concern in one part of the country to swamp or crush out local competitors all over the country. It would help build up the great retail mail-order houses. It would enable them to reach all parts of the country and undersell the local merchants because it would cost them no more to deliver their goods 1000 miles away than it would cost the local trader within his own village." This is a gross misrepresentation, for the facts are entirely to the contrary. The Postmaster-General proposes to allow local dealers to mail 11 pounds for 25 cents to persons on rural routes in the same locality. For long-distance packages the rate would be \$1.32, which is quite a difference. *The Shoe and Leather Gazette* can rest assured the farmers of this country are not stupid men. They can see clearly the tremendous opposition to parcels post

comes from people who have an ax to grind, namely, the express companies. The mail-order concerns are not anxious for parcels post.

#### ALFALFA FOR HORSES.

Mr. Joseph E. Wing, that prominent authority on alfalfa culture, says that for feeding to horses alfalfa should be allowed to grow till it is fairly *mature* before being cut. Sometimes it does not quite agree with them when first fed; but they soon become accustomed to it, and they are actually better for it. They take on flesh, work better, and feel better.

The last crop of alfalfa he does not think should be fed to horses, as it is not mature. The coarser crops grown earlier in the season are better. Neither horses nor mules should be fed all the alfalfa hay they will consume, as it is too rich a feed, and they do not need so much of it. This knocks the bottom out of the argument that alfalfa should be cut before it blooms, and "Joe" knows what he is talking about. He also says there should be no mold on the hay. That is an excellent point. There is only one remedy, and that is to cure the alfalfa under hay-caps in the field. When finally put into the hay-mow it will not mold or rot, because it has been thoroughly "sweated" already.

#### NEW BEE-KEEPING TERRITORY IN THE FAR SOUTHWEST.

If the Imperial Valley will hold no more bee-keepers until Harriman waters that small matter of 1,500,000 acres we must look around for other fields to conquer. There is some room at Yuma, on the government reclamation project, which will soon be ready. Then there is the great Salt River Valley project; but probably this will be fairly well occupied by bee-keepers now on the spot. There will be 300,000 acres of irrigated land at Parker, Arizona, where some one is building a great bridge over the Colorado River. There is a considerable body of irrigated land at Needles, on the Colorado, and more will be reclaimed. There are 40,000 acres available at Palo Verde, on the California side of the Colorado. The U. S. Reclamation Service has in mind an immense project on the Colorado, embracing Utah, Arizona, and California, which will cost in the neighborhood of \$40,000,000. That's some money to spend on a dam. This would completely dwarf the great Assouan dam on the Nile, and make a great paradise for bee-keepers, as alfalfa, dates, and oranges would be the leading crops. The date is a fine honey-yielder, excellent alfalfa, in my opinion, and, of course, the blossoms are not cut.

New Mexico, too, is forging ahead, and ere long will cut a figure as one of the important honey States. When the immense Elephant Butte dam is completed, a great stretch of land will become available for bee-keepers. Around Deming, pumping-plants are doing wonders in bringing lost rivers to the surface, and probably large areas elsewhere can be reclaimed. Southern Utah (Utah's Dixie) holds much in store for bee-keepers. Even oranges will grow, and the date is harder than the orange. Southern Nevada, too, is making headway, and for fruit culture they claim to have California "licked," whatever that

may mean. Oranges grow there also, but figs are in their glory and so are grapes.

Date culture will help bee-keeping, and I opine Texas will stand an excellent chance in this respect. Florida might cut quite a figure in date-growing, and probably the Sea Islands of Georgia and South Carolina. Dates do well in Bermuda and the West Indies, and it is amusing to see the bees at work on the blossoms. They simply crawl over the blossom as they do on a feeder until they fill up.

#### THE LORE OF THE HONEY-BEE, BY EDWARDES.

At last we have a rival to Mæterlinck, who not only writes well but knows bees and bee-keeping with certainty. It is evident that Mr. Edwardes is a bee-keeper, and keeps himself well informed on the latest developments in practical bee-keeping. For example, on page 96 he says, "If, therefore, the new system of plurality of queens both justifies and establishes itself, the near future may see a revolution in all ideas relating to beemanship. All that can be said for certain at present is that as many as five queens have been induced to occupy the same hive in peace and quiet together; but whether this portentous state of affairs can remain a lasting one is still to be proved.

"A curious and (to the expert) a startling outcome of these efforts to break down an old and almost universal custom in bee-life is that the successful establishment of several mother-bees in a single hive appears to lessen the swarming impulse. Hives so treated do not send out a swarm, so far as is known."

He is also at home on the physiology of bees, as his remarks on the morphology of the queen will show. On page 100 he says, "If the egg deposited in the queen-cell be removed, and an egg taken from any one of the thousands of worker-cells in a hive be put in its place, the worker egg will always produce a fully developed and accoutured queen-bee. On the other hand, if an egg be taken from a queen-cell and placed in a worker-cell it will infallibly hatch out into a common under-sized worker. It would be sufficient tax on the credibility if the differences of queen and worker were only those of degree. If the queen were nothing but a large-sized worker-bee, on which certain organs—which were atrophied in the worker—had received their full development, it would be a fact within comprehension; but the queen differs from the worker, not only in size and the capability of her organism, but also on several important points of structure. And how can mere food and air and circumstance produce structural change? The worker has many bodily appliances—special members ingeniously adapted to her daily tasks, of which the queen is wholly destitute; while the physical organism of the queen varies from that of the worker in several important degrees.

"Some of these must be enumerated. The abdomen of the worker is comparatively short and rounded; that of the queen is larger and longer, and comes to a fairly sharp point. The jaws of the queen are notched on their inner cutting edge; the worker's jaws are smooth like the edge of a knife. The tongue of the worker has a spatula at its extremity, and is furnished with sensitive hairs; the tongue of the queen is shorter, the

spatula is smaller, while the hairs show greater length. The worker-bee has a complicated system of wax-secreting discs under the honey-plates of its abdomen; in the queen these are absent, nor can the most elementary trace of them be discovered. In their nerve-systems the two show difference, the queen possessing only four abdominal ganglia, while the worker has five. The queen's sting is curved, and longer than the worker's; the sting of the worker-bee is perfectly straight. On their hind legs the workers have a curious contrivance which bee-keepers have named the pollen-basket. It is a hollowing of the thigh, the cavity being surrounded with stiff hairs; and within this the pollen is packed and carried home to the hive. In the queen, both the cavity and hairs are absent. Her color, also, is generally different from that of the worker bee, her legs in particular being a much redder brown.

"Here is a problem for our great biologists—a problem, however, at which the plain every-day man may well flinch; for we seem to have come face to face with new principles of organic life—facts incompatible with the accepted ideas of the inevitable relation of cause and effect. The irresistible tendency at this stage is to hark back—to repeat the experiment of the transposed eggs, and see whether no vital, initial circumstance has been overlooked. But the result is always the same. Nor can the most careful microscopical dissection of the eggs themselves reveal any differences. In this mystery of the structural variance between queen and worker, it would seem that we are forced to accept one of these alternatives: Either the egg contains two distinct germs of life, one developing only under the stress of hard times; the other, only the call to luxury; or we must go back to mediæval notions, and believe that the worker-bees give or withhold some vital principle of their own during nurturing operations; or we must give up the problem and decide that creation works on lines very different from those on which we have hitherto grounded our faith."

Here the author does a distinct service to bee-keeping by calling attention to a weak point in our knowledge of bee-life. Why can't we solve the riddle? Dickel and Kuckuck, in Europe, are trying their hand at it. Our theory of parthenogenesis is defective. Who will give us a better one? The parthenogenesis of the bee is different from that of most other insects and animals, and for that reason we can not apply to the regular biologists for an answer to our questions.

I make these citations to show the author is a deep student of bee-life. We want more writers like him. We want men who can get us out of the rut and keep us out.

On p. 125 the author commits one error in supposing no one has seen a queen lay in a queen-cell. She certainly does, and has been seen doing it. If he wants certain proof that a queen will lay in queen-cells, let him get a copy of Mr Pratt's book, "Forcing the Breeding Queen to Lay in Cell Cups." He can try the experiment himself.

Our author hazards a guess that bees may have senses we do not possess. For example, he surmises they can transmit thoughts without the aid of speech by means of their antennæ; or they

may go further, and transmit thoughts through space by means of a sort of wireless telegraphy. It seems reasonable.

I think the quotations given will show "The Lore of the Honey-bee" is an eminently readable and instructive book. It is about the same size as Mæterlinck's book, "The Life of the Bee," and is on the same general plan. Mr. Edwards has an advantage over Mæterlinck in making statements true to fact, while the other is often imaginary. The Belgian, however, makes up the difference when we come to consider the elegance of diction and subtlety of expression; in fact, no man living quite equals him in fine writing and pure eloquence. Both books are worth owning if one likes good reading. There are several very fine half-tones in "The Lore of the Honey-bee." The printing is excellent. It would have been better to have a nicer binding, in keeping with the rest; but that is a small matter. The publishers are Methuen & Co.

## BEE-KEEPING AMONG THE ROCKIES.

By WESLEY FOSTER.

---

### HONEY PRICES.

Producers on the western slope in Colorado have sold comb honey in single-tier cases at \$2.25 to \$2.50. This is somewhat below the price secured on the eastern side of the mountains, on account of the higher freight rates, and because the honey was not graded according to the new rules, which allow for a No. 1 light-amber grade, the quality of most of that honey.

Several producers have sold to dealers and buyers at \$2.30 to \$2.60, but this honey was not graded strictly according to the new rules, but was good weight. Honey graded and packed according to the new rules sold from \$2.60 to \$2.80 per case in double-tier cases. White extracted can be had at 7 to 7½ f. o. b. cars in several places in Colorado. None of my honey has been sold for less than \$3.15 for No. 1 white, and most of my No. 2 has been at \$3.00 per case, put up in double-tier shipping-cases of 24 lbs. each.

### HONEY EXHIBIT AT THE COLORADO INTER-STATE FAIR.

The exhibit at the Colorado Inter-State Fair, held in Denver, Sept. 7 to 12, was very good, for the size of the honey industry. There were few exhibitors, but they made up for this in the size and quality of the exhibit. The prizes were liberal, and paid the exhibitors well for the time and expense, besides advertising their goods in a very effective way. Bees in observatory hives drew the crowds, as did the demonstrations with live bees each afternoon by Pres. Collins, of the State Association. Mr. Collins' talks were very instructive and interesting, and he took a prize too, as a partial reward for his time. The real reward, however, will come in the added consumption of honey, which he strongly urged.

The ventilating-holes in the bottom of an observatory hive soon fill up with dead bees, and

are rendered useless. They should be on the end of the case instead of on the bottom. There is a marked difference in the length of time that bees live in the confinement of an observatory hive. A one-frame hive of Italians played out in about two weeks, even with frequent flights, while another one-frame hive of Italians have been in the glass hive in confinement most of the time for seven weeks, and still preserve the spirit of a well-ordered community.

An exhibit of bees and honey which my brother Wilbur put into a grocery in Boulder elicited so much interest that he was asked to give a talk with the observatory hive to the schoolchildren. This he did, and the attention and interest of the children were marked. The teachers questioned the children the next day, and found that they remembered every thing that was said.

Bees and honey are much more fruitful subjects than breakfast foods, and we should use as much energy in pushing our goods as the shredded-corn and toasted-oat manufacturers.

#### THE PAST SEASON'S CROP IN THE WEST.

Northern Colorado had a failure so far as shipping honey is concerned, only one car so far being sent out. The average yield per colony would not amount to more than seven or eight pounds.

Logan County, in Northeastern Colorado, had a fair yield, several cars being produced.

The reports from Southern Colorado and the Arkansas Valley are better, though no big yields have been recorded.

Western Colorado, or Delta, Montrose, and Mesa counties, have generally reported a good crop; several say it is better than that of 1907.

No report has come in from Montezuma Co., in the southwestern corner of the State; but in Northwestern New Mexico, which is just over the State line, no surplus has been secured from the parties answering inquiries.

Southwestern New Mexico has produced a good crop—much of it mesquite honey.

Arizona also has turned out quite a quantity of alfalfa and mesquite.

Nevada reports some honey. It is likely that the men who have honey answer the inquiries, and those who have none do not answer.

Utah is from good to bad, the Uintah country producing nothing for shipment, and the reports coming from north of Salt Lake, around Logan, are good.

Idaho had a fair yield, as did Wyoming, where there is sufficient alfalfa. One sample of Wyoming comb honey which I saw was very fine, and showed that the district from which it came had enjoyed a good yield.

Honey-dew was plentiful in several districts in Northern Colorado. The trees in Boulder dripped with it, and the bees literally covered the leaves. This lasted for fully two months, and what bees were close to the mountains and in the older settled parts suffered worst.

#### OBJECTIONS TO THE SINGLE-TIER CASE.

Comb honey is not wanted by the dealers in single-tier shipping-cases. Several cars of comb honey could be sold in the next week if the honey were put up in double-tier glass-front cases,

and there are several cars of comb honey in Colorado packed in single-tier cases, some without glass, and also lacking drip-sticks, and it would have paid the producers to study the market requirements more, and paid less attention to the few cents saved on a case. The objections are as follows:

First, in handling a carload of honey in single-tier cases one will feel twice as tired as after handling the same amount in the double-tier. One can not get the hand-hold as close to the edge as with the double tier, and there is less room for the fingers.

Second, if a case is picked up by the corners it will often twist enough in carrying to break or crack some of the honey. This is almost sure to occur if one carries two cases at a time and does not grip them just right.

Third, the top of the sections is flush with the top of the sides of most of the single-tier cases, making breakage almost sure. In shipping, expressmen and freight-handlers drop the end of one case in the middle of another case on the pile; and if they do this at all roughly the breaking of comb is certain. Cases are stepped on often, and a single-tier case simply will not stand this usage, while a double-tier case with half the surface is safe, provided there is an eighth-inch space between the cover and the top of the section.

Fourth, from the grocer's standpoint, the glass in a case is for showing the goods; and the more goods that are shown, the better the impression, and the more honey sold. Furthermore, it is a guarantee that at least a fourth of the honey is all right if a double-tier case is used.

Fifth, a single-tier case takes up twice as much room on the counter, showcase, shelf, or floor; and since one can not put any thing on top of it and still get honey out of it, the saving of half the floor space by the use of the double-tier places it far in the lead.

The objection brought against the double tier is that broken honey will leak on to the section below. Leaky and broken honey should not be cased for shipment any way, and experience shows that this objection is not worth considering.

There was a time when the production of the Rocky Ford melon was nothing. Several wise heads among the growers got together and decided on a plan of action. First, they had to teach the growers how to raise melons; then they united on the pony and the standard crate; and when they got the farmers so they could produce a good melon put up in the best crate obtainable they sent several carloads east and gave them away—making the people eat them. They had to have cars made right to carry off the gas from the melons and ventilate the car.

Bee-keepers must take much the same course. They must learn to use separators and honey-boards in place of sack covering for sections. No man but an expert with a fast flow can raise good honey without them; and who can positively foretell a fast flow? A uniform case, the double-tier glass front, has been adopted by Colorado bee-keepers. Let all use it, and grade strictly according to the rules.

Comb honey produced, packed, and pushed with the energy devoted to the Rocky Fords can meet with the same success.

# GENERAL CORRESPONDENCE

## EXTENSIVE WAX-RENDERING.

### Buying the Combs from Dead Colonies to Render for Wax; the Manley Wax-press.

BY E. D. TOWNSEND.

Two familiar figures at our State convention for the last few years are the Manley brothers, of Sandusky, Sanilac Co., Michigan. They are the parties who apparently turn failure into success; and I think I can not do better than to tell of some of their experiences as they have told it at our State conventions; then the reader will better understand what I have to say about their wax-press and method of rendering wax, and how they secure the material.

Sanilac County is low, level, and very fertile, quite a considerable portion of it being on the swampy order. Years ago, when the country was new, it was swept with forest fires until there was not much of the natural forest left. Later, in this burned district came clover, willow, and asters—the latter, sometimes, in a favorable season, yielding a large quantity of surplus honey. This aster honey is what makes the trouble, for during the winter after a season when the asters yield honey, nearly every colony of bees in this locality dies, sometimes only two or three colonies being left out of a yard of between 100 and 200.

A little incident illustrating how much confidence the bee-keepers in this location have in their ability to winter bees came out at our State convention at Saginaw last fall. A bee-keeper of this district having a yard of about 100 colonies, sold the lot for an average price of \$1.12½ per colony. This price was based on the value of the hives, combs, and honey, the bees not being considered, as they die early in the winter. Whole yards are often dead in February, and the honey left amounts to considerable.

The Manley brothers are farmer bee-keepers, and after the winter loss they scour the country for miles around, picking up wax material. They pay about 25 cents a set for the combs, and something also for the honey. A galvanized steel tank is taken along, as well as some large boxes. The empty combs are cut out into the boxes, and the honey-combs into the tank. This honey is afterward melted and strained, and sold to the bakeries. In this way they have no trouble in buying nearly every lot they come to, for most of these combs would be left to the moths, and the owner would receive nothing for them.

At our State conventions in years back the Manleys have been asking for instructions to make a wax-press that would render wax economically, as they were in the wax business extensively, and could not tolerate the slow-working presses on the market. They had tried the plan of working several presses at a time, which help-

ed matters somewhat; but they were not satisfied, as they wanted something that would handle a large quantity of old combs, but there did not seem to be any. At our last convention at Saginaw, Mr. W. J. Manley reported very good success with a press which they had gotten up; by request he describes it here:

There is nothing original about this press as I stated at Saginaw. It is a sort of combination of the Hatch, Root, and Hershiser ideas, and the press is only one feature of the process. However, I have experimented extensively, and it is the best thing I have found yet. I rendered over 1500 lbs. of wax with it last spring, and was very much pleased with it. It is not perfect; but I can take the oldest, blackest brood-combs and turn out 20 to 25 lbs. of fairly good wax per hour, and make a thorough job of it too.

The press is a built-over Root-German—in fact, it is all Root-German except the can. The new can is built of heavy galvanized steel, is 15 inches in diameter, and 18 inches high. Two inches from the bottom a spider is riveted, for the perforated basket which contains the combs to rest upon. This arrangement provides for plenty of water to circulate under the cheese, on the Hershiser principle of the washing-out of the wax, as will be explained later. We transferred the Root screw and plunger, with oak cross-arm, into our press, and also the perforated iron basket. We had to reinforce the follower with a plate of iron on top to keep the wood from warping; also the oak cross-arm, to keep it from springing. We had trouble until we did this. The two lugs were riveted to the top rim of the tank for the burrs on the cross-arm bolts to slip under, as on the Root-German.

A large-mouthed sack, like a potato-bag, is the best thing we have found to hold the combs, when the top is cut off to the desired length. The combs can be more securely held than in a square piece of burlap, especially when they are being submerged. Besides, it does not require so many square feet of burlap, which is important. We press only one cheese at a time. As we use two boilers we do not attempt to melt all the combs that could be melted in each one, but simply fill each boiler in its turn with dry combs tramped in moderately tight. If the combs are old, hard, and black, we find about two eight-frame Langstroth brood-chambers furnish enough material for a batch; if only moderately so, four or five sets of combs can be run in a batch.

We then pour in water until it comes up two-thirds of the way in the boiler. This will all go into the press nicely in one batch, and furnish plenty of water to make a thorough job of it. The contents of the boiler are kept stirred, and, when melted, are dipped and poured into the sack previously arranged in the press. The top of the sack should be straightened up, and held in this position until the free wax and water work out into the press-can; then the top of the sack is rolled or folded down, the plunger put in, and pressure applied. In handling the hot sack gloves are worn.

In the washing-out process we raise the plunger usually twice by unscrewing it a little and allowing time for the slumgum to become saturated with water; then screw down again. This part of the process does not take more than ten minutes; for where there is only one cheese, and that not over one inch thick at the most, the wax can escape readily into the water in every direction as pressure is applied, and the work is soon done. We have never tried more than one cheese in this press; it is too slow and fussy. We have tried putting the slumgum through the second time, but it does not pay since using this press.

When through pressing, while the plunger is still screwed down tight, the hot water and wax in the press are emptied into a wash-tub provided for the purpose. We use but one tub for this purpose, and also use this same hot water for the next batch. There is a little knack in cooling the inch or so of wax that is on top of the water in the tub, without cooling the water underneath to any great extent. It is accomplished by splashing on cold water in sheets, thus causing the wax on top of the water to congeal, so it can be removed immediately. This is very quickly done with a common ten-cent sieve dipper, such as house-keepers use for straining soups. Repeating this operation every few minutes in such a thorough manner constitutes the chief merit of this system; thereby we can turn out a large quantity of wax of good grade, in a short time. We have rendered in the last four years nearly 10,000 lbs., but we have used this press during only a part of the last season, and have rendered out about 1500 lbs. with it. An eight-frame Langstroth brood-chamber yields with us about 2½ lbs. of wax on a general average, and extracting-combs from 2¾ to 3 lbs.

We have spent considerable money and time experimenting on the wax-rendering proposition; and this plan of melting the combs in boilers, and turning every thing out into a press that is operated a few feet from the heat of the stove, and down where we can get at it to work, is the most thorough and expeditious of any thing we have found yet. We use the tank of the Root press to remelt this wax, and get it in shape to mold. Our stove is large enough to hold the two boilers and this Root tank all together; and as soon as we get a 5 gallon can (with top cut out)

full of wax in the rough we dump it into the Root tank, cover it over, and as fast as it melts it runs out of the spout into one of those gravity separating pails described in GLEANINGS three or four years ago by Mr. Aikin. In this way a sort of "perpetual motion" is kept up; and when through rendering the wax it is ready for the market.

W. J. MANLEY.

We have rendered our wax this year in one of the new Hatch wax-presses. The wax was handled as near to the Manley plan as possible. Instead of setting the press down near the floor, it was elevated so a wash-tub could be put under the spout. We dip the melted combs from the boiler into the press with a large dipper, continuing this until only enough water and wax are left in the boiler, including what there is already in the press, to fill the press-can within about an inch of the top. Previous to this the wax and water were allowed to run out of the bottom of the press as usual; but now the outlet at the bottom of the can is corked, and enough water and wax retained to fill the can of the press as I have explained. The edges of the burlap should be brought together and twisted, and the pressure applied. The screw is then loosened two or three times to saturate the slumgum with water, on the Hershiser plan. Then on the Manley plan, when the screw is down tight, the water and wax are turned from the top of the can into the tub.

The can of the Hatch press is large enough to hold sufficient slumgum to make a cheese an inch thick, as the Manleys recommend; and by leaving the press open until there is only enough material left to fill the can, the rest is retained to keep the slumgum hot, and more particularly to secure the Hershiser "washout" principle. We succeeded in this way in getting a larger per cent of the wax out of the slumgum than by using the press in the usual way, because, ordinarily, there is some wax that congeals on the burlap, while with the washout principle the burlap comes out of the press clean of wax. Whether the slumgum with this washout principle will need to be run the second time to free it from the wax, I can not tell, having tried it in such a limited way. Ours was run the second time, and it looked as if the second trial would pay; but I am not ready to say it will pay, without more experience. The Manleys make a good point in using two inches of water under the cheese, and lots of it above; the less amount of water used in the Hatch press may make it necessary to run the slumgum through twice, while once is all that seems necessary with the Manley press. One thing I am sure about with the Hatch press worked on the washout principle, in running the slumgum in particular, there was not a particle of visible wax sticking to the burlap, and somehow I felt as if there was less wax left in the slumgum than usual.

I have always used the square Hatch-Gemmell press; but after using the new Hatch press I am sure that the round form is better. The whole cheese can be brought nearer the center, which means that there is less strain on the screw and other parts. Then the round form, with a follower that fits out close to it, prevents any part of the cheese from slipping out at one side, so that it is not pressed. There are also no corners to cool, etc.

Where there are large quantities of old combs to render, or where one is in the wax business as extensively as the Manleys, something larger

than the Hatch press will, perhaps, be needed; but for the ordinary bee-keeper having 100 colonies or less, with the wax material as it usually comes from a yard of bees in normal condition, the Root-Hatch press will be satisfactory if worked by directions that come with the press. Then if the slumgum is run through the second time on the Hershiser washout plan as I have given above, there will not be a very large amount of wax left, and the work will not be so very tedious after all.

Remus, Mich.

[The process of rendering as described by Mr. Manley is quite similar to the Sibbald method illustrated on page 210, Feb. 15. Mr. Townsend's article was written last March, and at that time Mr. Manley had probably been using the method as described, for over a year.

About two years ago we tried the hot-water plan in connection with the Hatch press; but at that time we felt that the use of the water did not facilitate matters. However, some may find that the plan suits their convenience better. We should be glad to have reports from any others who have used the Hatch press in both ways.

We believe Mr. Manley is right in pressing only one cheese at a time. Where the water can be kept hot, as in the Hershiser plan, so that the intermittent pressing can be kept up for some time, a number of lots of comb can be pressed at once.

For the convenience of our readers we here-with reproduce the engravings illustrating the wax-separator as described by Mr. Aikin in the Jan. 15th issue for 1902, which is probably the separator to which Mr. Manley refers.

We should be afraid that the average person would find it rather difficult to cool the wax on top of the hot water. We have found it a good plan to leave the wax floating on top of the hot water until the work is done. When hot water is wanted, it may be drawn from the bottom of the can through a faucet or gate.—Ed.]

## IS DENSE SHADE OBJECTIONABLE?

Bees Return to Hives from Miller Escapes;  
How to Grade Honey Properly.

BY J. C. DAVIS.

I thought that the shade might be getting too dense in my apiary, so I trimmed the trees. The upper view shows the yard as it was, and the lower one as it looks now. At the time I did the trimming I was not sure that I was doing the right thing, and I am not sure yet whether the shade was any disadvantage. The best colony in this yard in 1906 was No. 6 in the back row, where the shade was the most dense. The same colony was the second best in 1907. There were about 150 colonies when the photos were taken, September, 1907. The colonies in the front

rows get more sunshine, and they winter (or, rather, spring) a little better, and the surplus averages a little more from them. Since doing the trimming however, there is very little difference. The trees are second-growth oak, hickory, and elm.

As may be seen, there is a Miller escape on top of one of the hives in the lower view of Fig. 1. I use both Porter and Miller escapes, and I find them both good. If I have plenty of time I use the Porter; if not, I use the Miller. I have watched closely, and I think that the bees all return to their own hives from the Miller.

Fig. 2 shows section honey as I grade it. I always sell by the case, and the grocers prefer to have it that way when *so graded*. They often sell other ungraded honey by *weight* at the same time.

This has been a very poor season here—about 10 or 15 per cent of a crop from the best strain of Italians, and a total failure from the blacks.

Bethlehem, Iowa.

[We believe there is no question but that *too* much shade is too much of a good thing. An ideal shade is that which spreads over the hives only during the middle hours of the day in hot weather; but at all other times it is best not to have any shade, although where one uses natural shade, that is a matter difficult to control, ordinarily. If one uses shade-boards, and applies them just as soon as hot weather comes on he will have to put himself to considerable expense and trouble—that is, the trouble of putting them on in the first place, and then more trouble every time a hive is opened, especially if he uses a 15 or 20 pound stone to hold the shade-board down. But the ordinary shade-boards, unless made very elaborate, do not furnish any adequate shade in the hottest weather. The bees are not fully protected, and swarming is aggravated.

It was the late E.

FIG. 1.—J. C. DAVIS' APIARY BEFORE AND AFTER TRIMMING THE TREES.  
Mr. Davis did not notice any material difference in results after getting rid of the dense shade.

W. Alexander who said he conducted some experiments along the line of natural shade for a number of years, and generally found that a hive continuously shaded did not do as well as one that had less shade. Others have reported something similar. Still, to settle the question beyond peradventure, we wish that all who are in position to know would state their observations.

The illustration showing three gradings of comb honey is certainly very interesting. We should say, according to the Eastern grading-rules, published at the head of our Honey Column, that the top case would really rule extra fancy, while the middle one would run fancy, and the lower one No. 1 and 2. The tendency, however, is rather to boost the gradings, putting them in a little higher than they rightfully deserve. A comb is regarded "fancy" nowadays when all the cells are sealed and white, except the rows next to the wood. If all or nearly all the cells are sealed, then the grades would necessarily be "extra fancy;" but it is very difficult to get sealing clear out to the wood; and it is a question whether the extra price secured would warrant the extra cost in proportion. Such forcing to get all the cells sealed is likely to induce swarming. It has been claimed that more money can be secured by producing a strictly No. 1 comb honey than by attempting to run for an extra-fancy—that is, combs white and all sealed. We should be pleased to have some discussion on this point.—Ed.]

FIG. 2.—PROPERLY GRADED HONEY.

Honey that is carefully and honestly graded may be sold by the case.

enough to keep weather changes from affecting the temperature. I have also a ventilator 12×12 inches in the center of this cellar, with a shutoff at the bottom, which I keep closed within half an inch during the time I keep the bees in the cellar. Last winter the temperature in the center of this cellar stood 45 degrees all winter. I keep a thermometer hanging in the center of this cellar so I can see at a glance what the temperature is.

Before putting colonies in the cellar I first get them to rear brood as late in the fall as I can so as to have as many young bees as possible to go into winter, then I see that each colony has sufficient stores to carry them through. On the first day during the last week in November, when it is too cold for bees to fly, I put them in. I pile the hives one above the other with a six-inch stand under them on the ground, nothing between hives excepting lids, bottoms left on with full-width entrance  $\frac{3}{8}$  deep. I examined the bees every two weeks last winter, and found them perfectly quiet on each visit. I set them on their summer stands April 7, without loss. I locate the hives with the entrance toward the wall, but far enough away so I can pass in front to clean out the dead bees occasionally.

I keep all of my bees in modern self-spacing movable-frame hives, all swarms hived on frames containing full sheets of wired brood foundation. Each super is provided with full sheets of foundation, enabling the bees to build comb quickly, thus giving them more time to store surplus. The swarm shown was cast from a colony that produced 180 pounds of comb honey this season.

Before I proceed further I shall have to tell you about my experience at the fairs. I procured one

## A CONCRETE BEE-CELLAR.

### Good Management Means Good Yields.

BY J. W. DAVIDSON.

My bee-cellar is built in a northwest slope. The main room is 7 feet deep, 15 feet long, and 10 feet wide. I have a vestibule with double doors at entrance. This cellar is constructed of concrete made of the best Portland cement mixed in the proportion of one part of cement to six parts of sand. The walls are 5 inches thick, and they contain a considerable amount of broken stone. I use a ground floor. For the roof I have two thicknesses of inch oak boards covered four feet deep with clay well tamped to make it absolutely weather-proof. That is, it is covered deep

of your observatory hives and put some of my nicest bees in it on a frame well filled with honey, and also had the super on with nice white honey in it. Then I had, near the side of the hive, a case of comb honey and another containing two extracting-frames of honey, and I do not think that any one passed this exhibit without seeing it, and the first thing they would want to know was how much honey I

DAVIDSON'S CONCRETE BEE-CELLAR.

THIS SWARM OF BEES ISSUED JUNE 7 FROM A COLONY THAT PRODUCED 180 POUNDS OF COMB HONEY THIS SEASON.

got this season. I would tell them, and also explain my method of management by showing the hive with the super so convenient for the bees to store in.

I found a number of bee-keepers who still used the box hive without frames, with simply a hole in the top of the box for the bees to go through to store surplus. They said they had a good yield, but nothing to compare with mine, and then I explained the difficulty of bees having to enter the super through a small hole in a box as compared with a hive and super such as I used. This got me into business, and I have booked 60 colonies to transfer next spring if they winter.

Yorktown, Ind.

## TWO METHODS OF QUEEN-REARING.

BY E. R. ROOT.

Mr. Pritchard, who for some time has reared queens at our north yard on contract, says it is more economical for him, and he thinks he gets better queens by so doing, to give cells, just as they are about to hatch, to nuclei rather than to introduce virgins one, two, or three days old. He found the bees would tease a percentage of the latter, killing some and maiming others to an extent that he lost quite a number of perfect queens; so during last summer he pursued the plan of giving only cells to the nuclei.

Our Mr. J. W. Bain, who has charge of the home yard, has been working gradually toward the other policy, that of introducing one-day-old virgins at the entrance of full colonies and nuclei. He says he has no trouble if his virgins are strong and vigorous, and they are allowed to run at the entrance when *not more than one day old*. When one, two, or three days old a few will be teased

THE BAIN NURSERY CAGE AND ITS USE AT THE ROOT HOME YARD.

or rejected. He accordingly has all his ripe cells attached to wooden cups let down into a wooden cage that he has devised, see illustration, so that, when a virgin hatches, she is in a little wooden box with wire cloth on one side. Within 24 hours she is allowed to run in at the entrance of the hive that is to receive her. To accomplish this the cage is opened so that the mouth of it is directly in front of the entrance of the nucleus or hive, as the case may be. Soon she will crawl out, but may have to be "steered" with a spear of grass until she gets her nose pointed toward the entrance, when she will likely run in. Mr. B. says the fingers must not or better not come in contact with the queen. She must have no foreign odors clinging to her. The younger the queen the quicker she will crawl into the entrance. If too old she will be timid, and this has a bad effect on the bees.

One advantage of introducing young virgins instead of giving cells is that it allows one to select the best queens and discard the others; whereas, when a cell is put into the nucleus, if the hatching virgin is not what she ought to be, time is lost. While she may be removed and another cell given, the whole process has to be repeated.

Another and very important advantage in this virgin plan, says Mr. Bain, is that the cells clear up to the exact moment of hatching, are incubated in strong colonies where colony temperature will always be right. This insures large vigorous light-colored queens all hatching at almost the same hour; whereas, he says, a cell given to a nucleus may suffer a reduction from the proper temperature, and this will necessarily affect the queen within the cell.

In large queen-rearing operations it will happen, however, that it will not be possible to have in readiness a queenless nucleus or a hive for every queen before she is 24 hours old. Then one will have to introduce in the regular way, taking his chances on having the queen injured.

The illustration accompanying shows a batch of 24 cells, in as many cages, all of which hatched

a queen save those where the cell is seen projecting down, and from which the queens had not emerged. All of these queens were exceptionally large and a bright yellow. They were so beautiful, indeed, that we could not resist the temptation to take a photo of them; but we regret that the reproduction here does not begin to convey the relative sizes and beauty of the queens. They were as handsome a lot as we ever saw, hatching within an hour of each other.

The cage is one that is preferred by Mr. Bain and of his design. It is a simple  $\frac{3}{8}$ -inch block  $1\frac{1}{4} \times 2\frac{1}{4}$  with one side chambered out as shown. This is accomplished by boring three one-inch holes nearly through the wood. Both ends are then bored out, one to receive a cell and the other a feed cup; after which the open side is covered with wire cloth. Mr. Bain prefers to have one side of solid wood so that the virgin has a secure resting-place clear from the reach of any hostile worker that may be in the nursery hive. By having a hole through *both* ends of the cage a queen that is not disposed to go out can be pushed out.

## A SWARM THAT SENT SCOUTS TO THE WALL OF A HOUSE.

BY FRANK C. PELLETT.

Last summer we were remodeling our house, and a large portion of the weather-boarding was taken off one side, and sheeting and building-paper put on. This was left partially unfinished for some time, and we noticed a large number of bees going in and out of an opening for several days as though they had taken up their residence there. Finally a very large swarm came and went at once into the opening. I was ready for them, and filled up my smoker and drove them out at once, when they clustered on a limb of a large apple-tree near at hand, and were soon hived. A few days later we again noticed bees at work there, and they continued to do so for several

days, when a swarm came on as before. This time I was not at home, but Mrs. Pellet saw them going in. After coming home I tried again to smoke them out, but met with poor success, as they had become pretty well established and would return as soon as the smoke let up. After considerable difficulty we reached the swarm through a hole in the partition wall inside of the house and drove them out, only to have them return as soon as we stopped the smoker, so we gave it up. I think, however, the queen was killed in the mix-up, as the bees stopped work and loafed around, disappearing entirely in a few days.

While we had bees ourselves I am satisfied that these came from a distance, and there is no question in my mind but that the advance agents fixed up the quarters to suit their requirements.

About the last week in April I noted a commotion in front of ones of the hives in our bee-yard, and went to see what was the matter. In front of the hive on the alighting-board was a bunch of bees making a big fuss over something. I carefully brushed them aside, only to find a queen badly disabled, but I can not make up my mind whether the bees were driving her out to be replaced by a younger one or whether she was a stranger that had made the mistake of entering the wrong hive. Unfortunately the hive is one in which the combs are built crosswise, so that we could not investigate the conditions within, so are entirely in the dark. I took the queen

away from the bees, but she was not able to walk, so was of no value. Will some one with wider observation please tell me the cause of this commotion?

Atlantic, Iowa.

[It is quite likely that the queen on the alighting-board was one which was returning from a flight, and had mistaken the entrance.—Ed.]

### A BACK-LOT BEE-KEEPER; BEE-KEEPING FOR PLEASURE AS WELL AS PROFIT.

BY WALTER S. POWDER.

The engraving below represents the little home apiary of Dr. Henry Jameson, of Indianapolis, and is a fair example of what pleasures can be acquired by keeping a few hives of bees in large cities as a pastime and a change for recreation. The doctor derives a great deal of pleasure from his flower-gardens, one of old-fashioned flowers, and the other of up-to-date flowers, and also from his motor car; but I will venture that nothing has given him more pleasure this summer than taking care of his bees.

He began his first experience on the 23d of May, with two three-frame nuclei in chaff hives and an extra hive to be used in case a swarm should issue. By spreading brood and adding

APIARY OF DR. HENRY JAMESON, INDIANAPOLIS, INDIANA.

RICH'S OBSERVATORY HIVE; BROOD SIDE.

frames with full sheets of foundation he soon had them ready for the supers, and on July 10th he had removed 111 sections of honey from the two hives, and 48 unfinished sections still remain, with a prospect of being finished with a fall flow.

The report is a good one, and shows what can be accomplished when a man is determined to excel in his work, and this is Dr. Jameson's method in all which he undertakes.

Indianapolis, Ind.

### OBSERVATORY HIVES.

**A Side-opening Hive that is Useful as well as Ornamental.**

BY GEO. W. RICH.

The illustration shows the front and back of my observatory hive, which is not only nice for observatory purposes but as good for comb honey as any other hive. The front is four frames high and two deep. The frames are made after the Hoffman pattern, but are only 7 inches deep. The cleats that support the frames go across to hold the section-holders and

fences also. Next to the brood-frames are the fences, then holders with sections, and another row of fences and holders with sections complete the hive, making forty 4x5 sections in all. The hive is opened by removing four screws through the sash. To exclude the light I have a frame covered with rubber roofing that hooks in place over this sash. The spots on the glass show the brace-combs. The photo was taken at a time when there was but little honey in the hive.

Trezevant, Tenn.

[The method here shown is something like the plan used in Germany. The hives are not *top* opening but *side* opening. It is a very slow, tedious process, perfectly permissible in an observatory hive, but intolerable in a hive for general honey production. Of course, some of our German cousins may think otherwise. But it seems like a lot of work to take out every frame to get out the frame on the far side, or half the frames to reach one in the middle. They claim a hive with a movable roof is unhygienic because it allows the natural heat to escape too freely; at least that is the claim made by Berlepsch and Dzierzon.—ED.]

RICH'S OBSERVATORY HIVE; SURPLUS SIDE.

## TRANSFERRING FROM BOX HIVES.

### A Quick Way of Doing the Work Without Greatly Disturbing the Bees.

BY J. J. WILDER.

Prepare as many hive-bodies, using full sheets of foundation in the frames, as there are box hives to be transferred; and in early spring, or as soon as the first honey-plant begins to bloom, turn a box hive so that it rests on its back. Then, with a hatchet or ax, split the front side, which is now the top, in pieces about 2 inches wide, and remove the one which has the least comb attached to it, working it out carefully so as not to tear up any comb. A long-bladed knife can now be used to cut the comb from the rest of the strips, and remove about 12 inches of the wood in the middle, leaving just enough at either edge so that the prepared hive when set on top will have a good level foundation to rest on. If the box hive is narrower than the new one, nail straight-edged strips on either side, flush with the top.

If the bees have not rebuilt the comb in the top of the box hive since it was robbed, fill the space with straw, hay, or burlap sacks, or any thing the bees will not gnaw away. If this is not done the bees will fill it with new comb, and the work in the new hive will be retarded. If the comb in the box hive was removed to a depth of over 6 or 8 inches, and not rebuilt, reverse the hive so the top will be about where the entrance was, and remove the cover and nail it on the bottom end so the end of the new hive will rest on or against it.

The front end of the box hive (the bottom when the hive was standing) can be left open; but the rear should be closed so no cool draft can pass through it during changeable weather.

Now set the prepared hive-body on the box hive, making sure that there are no cracks at the sides or back, and place a short piece of plank over the portion of the box hive in front, which the new one does not cover. (See illustration). It is best not to close up the opening in front to a small entrance, unless the apiary is large or robbers bad; for the queen would then occupy more of the old comb, and delay the establishing of the brood-nest in the new hive, which she should do as soon as the foundation is sufficiently drawn out. After all the box hives in the apiary have been thus treated, and work is under headway in the new hives, put on supers as fast as they are

WILDER'S METHOD OF TRANSFERRING FROM BOX HIVES.

needed, so the queens will not be crowded out of their new quarters.

An apiary in this condition can be operated for honey or increase, and better stock can be introduced at the same time, and at the close of the season or late in the fall all the bees should be driven up, and the new hives set down on bottom-boards. If any bees remain in the box hives they should be jarred in front of the new hives, and the old hives set a few steps away. As soon as the bees remove all the honey from these old hives they should be taken away and the comb rendered into beeswax. At this time of the season there is little if any brood lost.

If colonies in box hives are weak at the time of transferring, it is best to unite several of them, which can best be done by preparing one hive as above for every two or three hives to be united. Then all colonies should be disturbed so the bees will fill themselves with honey, and cluster on some part of the hives, when they may be dumped into the one prepared for them.

I have been troubled but little with swarming in apiaries managed in this way, and the colonies have not failed to harvest a good crop of honey when seasons were favorable.

Cordele, Ga.

[In most localities a steady honey-flow could not be relied upon, and robbing would surely begin during the first honey dearth, if the combs at the bottom of the old hive were left exposed. In such cases we would advise the Heddon short method—viz, drumming two-thirds of the bees up into a box placed on top.—ED.]

The only reliable, ever-ready, self-adjusting hive-lifter. It is adapted to all localities, is easily and quickly placed in position, and easily managed. Every lady bee-keeper should have one.—J. L. ANDERSON, Harvard, Ill.

## THE UNIVERSITY OF CALIFORNIA.

### What it is Doing for Apiculture.

BY RALPH BENTON,  
*Instructor in Entomology.*

We are interested in observing the general movement in the direction of apiculture in our agricultural colleges and experiment stations. This subject in the University of California was first taught during the academic year of 1893-'4, and since that time it has formed a part of the regular instruction in this institution. The present instructor in entomology in charge of apiculture came in touch with the work in California in the spring of 1905 when serving as Assistant in Apiculture in the Montana Agricultural College, where, under the direction of the entomologist, he has been in charge of the teaching and experimental work in apiculture since the year 1901.

The past three years have witnessed a distinct advance in the amount and scope of the work being done in apiculture. The number of courses offered, from two repeated twice a year, has been augmented to seven, three of these being repeated twice a year, and two being capable of election indefinitely without repetition of work as research courses. The distinctly apicultural courses are now announced separately from entomology, giving apiculture a recognition and permanence co-ordinate with entomology as a sub-department under agriculture such as has never before been given to this subject in any institution of higher learning in America. It is now not only possible for a student to get his B. S. degree in apiculture, but increased facilities are being provided

for research work looking toward higher degrees for those qualified for such studies.

The University apiary numbers forty colonies, and has representatives of each of the six varieties of bees of economic importance. There is now available equipment for thorough instruction in comb and extracted honey production, wax production and manipulation, queen-rearing operations, and bee disease investigations. Apiculture will from the first form a part of the school work on the University farm at Davis, where instruction is to be begun this winter. In connection with this instruction work on the farm there is to be established a well-appointed experimental apiary with an apiarist in charge. There are also three out-apiaries with the owners of which the University has made arrangements for co-operative tests of methods of practice and varieties of bees on a more extensive scale. Arrangements have been made with several more of the larger commercial apiaries of the State for advanced students to spend their summers in practical experience in apiary management.

Whether this work of the past fifteen years, culminating in the more recent rapid advances, is to be permanent or ephemeral, as has been the case in every other institution in this country where apiculture has received attention, remains largely with the bee-keeping public. The authorities have been responsive. This has been true in some instances elsewhere. But there seems to be a normal limit to the amount of work that State institutions are willing to do in these untrodden lines, without precedent, merely upon the suggestions and recommendations of those personally engaged in the work. The rank and file of bee-keepers must plead their case incessantly and concertedly if they would finally triumph.

## EUROPEAN NOTES.

## German Ideas Regarding Heather and Dandelion Honey.

BY J. A. HEBERLY.

The details of bee-keeping are dictated to the expert by climate and flora. Only a thorough knowledge of the time of the honey-flow enables him to obtain the best possible results. For this reason I should have thought that on account of the time at which the various plants and flowers begin to yield nectar and pollen, and the length of time any flower in a particular locality secretes nectar, would be more frequently met with, as this would be interesting for comparison.

Regarding heather honey, I will say that your correspondent is misinformed, at least as far as Southern Germany is concerned, because heather honey is here considered inferior; but I infer that in Northern Germany it is also considered inferior, since I frequently see such honey advertised at nearly half the customary price. This honey is from *Erica vulgaris*, and is so viscous that it can not be extracted—at least not in the ordinary way. The flower opens here Aug. 10—12, but in other parts earlier.

Another heather, *Erica carnea*, ling, which does not grow near here, blooms in early spring, and yields nectar and pollen when old snow may be near by in quantity. I do not know, but I believe that honey from *Erica carnea* is much finer, but none is to be found in the market.

Dandelion grows here in abundance, opens about May 15, and lasts two weeks. The honey from it should be extracted as soon as the flow ceases, because it will break the combs later on when trying to extract it. It is of a deep-yellow color, and crystallizes, after extracting, in a week or two. It is rich in ethereal oils, and on this account people accustomed to mild honey find it too strong. Some consider it rank; most get to like it. It keeps well, and seems to improve with age. Owing to its viscosity and the tendency to crystallize so rapidly it would not be a desirable winter food. Since it is the first honey early in the season, I think none is left in the fall to make the bees "thirsty" in winter; but if any is left it is so far from the center of the brood that it won't be reached until the bees can fly again.

I wish to state that my opinions and observations are based on experience here, and may often fail to be reliable in your country, owing to the different conditions. Honey from the dandelion is the only variety of which I know that should be extracted as soon as the flow ceases. All the other honey should be capped—at least any frame two-thirds to three-fourths full before being extracted, because uncapped honey is unripe and inferior to capped honey from the same source. I was amazed to see plans discussed for ripening honey artificially. Such honey would be inferior to that ripened in the hive; but where an excess of aroma is present it might do, because a slight loss of ethereal oils might then mean no harm. I do not see why bee-keepers want to extract unripe honey. They save a little time, not having to uncap much; the yield is increased just a little; but these are only seeming advantages, because the inferior quality of unripe honey will

mean a greater loss in price. Whenever honey is sold according to quality it gives more trouble to sell, and should be sold rather early, because it won't keep so well; in fact, there is a possibility that it might become unsalable while ripe honey may be kept, under favorable conditions, for years. Besides all the advantages—yes, even if it were a slight disadvantage to extract only ripe honey—I think the bee-keeper should have so much pride and moral courage that he will offer only the best honey that he or any one else in that locality can produce, in a clean, neat, and attractive package.

Regarding sugar feeding (cane sugar is identical with beet sugar), it is best here to feed early. One to one or just a little more is deemed best. By late feeding, as much as two to one may be used. Speculative feeding should be commenced in August. In spring it is not advisable, because the bees become excited, and fly out when the temperature is so low that large numbers are unable to return. Here not more than 5 to 7 lbs. should be fed unless the locality produces honey unfit for wintering, such as from Scotch or silver fir and honey-dew. Sugar should be fed only in the fall—never in the spring—because brood-rearing does not progress so rapidly as with honey; besides, there is danger of some sugar syrup or invert sugar being carried up into the extracting-super later on when making room for the queen. This may also happen when feeding very large quantities of sugar in the fall. The natural food for bees is honey—not sugar.

I would never recommend any kind of acid to invert the cane sugar, but let the bees do the inverting. I am inclined to think the acid might be injurious—more so than the work of inverting. The bees might be injured, and the bee-keeper never know of it. It may shorten the life, lessen the energy, and escape completely our observation.

## SPRING LOSS.

We have had verandas (cloisters) for years. These should exclude light and provide shade, and should not interfere with the exchange of air. On no account should the bees in warm weather be confined. As soon as they find that they can not get out they become alarmed, excited, and may with their dead bodies prevent the entrance of fresh air, and thus endanger the colony. These verandas provide about a cubic foot of space, and are valuable where bees are kept during the winter on their summer stand. During winter, when there is no danger that the bees will fly, the door of the veranda is shut. No mouse, bird, rain, wind, or snow will trouble the bees. In spring, however, when it gets warm, the door of the veranda must be opened. If a shade over the entrance is provided, it will save many bees. Mr. Weber's entrance-controller would, according to my experience, be much improved if he would leave out the wire cloth; as it is, it would be dangerous here; then the bees can get out if they want to. No harm will be done, and at the most dangerous time fewer bees will fly out than without it, and therefore fewer get lost. Mr. Halter's storm-door will do about the same. If the bottom-board is sufficiently long, a combination of the two might be an improvement; but instead of the A A notches I would suggest putting a small block or stick

on the bottom-board so the board or storm-door would be raised sufficiently for the bees to enter. This arrangement needs no attention, while veranda doors must be opened and closed frequently in the spring if any good is expected from them. If in the spring the doors are not opened when they should be, the loss or danger might be as much as or more than if the hive had been left to itself with no protection. I find the verandas at least as valuable in winter as in spring. If I were in America in a location protected from the north by forest or mountains, so the north wind could not bother the bees much, or in a locality that is not troubled with north winds, I would turn the hive entrance of a part of my colonies to the north; then the bees would fly only in weather that would not be dangerous. I think the danger is greater here than in most locations in America, because bees are kept in bee-houses with the hive entrance to the south. The sun shining on the building has more power to entice bees out in spring when the air in the field is cool enough to chill many of them. I am inclined to think most damage is done when the weather changes rapidly at noon or in the afternoon. The bees are out, and not able to return; but no protection will avert loss from such a sudden change of temperature.

Stoetten a. A., Bavaria, Germany.

## TRoubles OF A BEE-INSPECTOR.

**Some Problems that Confront Inspectors in their Work; Some Suggestions in Regard to Inspection and to the Laws Controlling it.**

BY C. A. WURTH.

This is a subject that is rarely touched upon in the columns of any bee-journal, and it may appear to be a little out of the ordinary to present some of the following suggestions to intelligent bee-keepers; but I am of the opinion that GLEANINGS numbers among its subscribers not a few parties who have no knowledge of bee-diseases, being so ignorant of this important subject that they lose their bees by one disease or another, and never guess the cause.

In my experience as a bee-inspector I find parties who question the existence of bee-diseases, and it is a hard job to convince them that they are wrong, as it usually occurs that a person so ignorant as to question the existence of a contagious disease among bees is conceited, and all of the evidence brought to bear is of no avail. The best way to convince such people is to bring action against them in the court; for, although they may not be convinced they can be convicted of violating the law, and, after once being compelled to pay for their stubbornness, they will yield to the wishes of the inspector on the next occasion. I do not advise indiscriminate prosecution of any one; but when it is necessary I believe in penalizing to the limit. It is folly to let any one maintain a position whereby he disputes facts, established by scientific analysis made in our government laboratories by qualified men who devote their energies to the study of just such diseases.

A bee-inspector is often placed in very embarrassing circumstances. A person capable of fulfilling the duties of inspector should be a competent and well-informed bee-keeper; therefore if he is an apiarist, owning bees near where his services are required, he is placed in a position whereby he can be accused of using his authority to further his own interests. For instance, if it is necessary to destroy some colonies, the owner at once takes this view. Of course, this accusation is fostered solely by parties who are either ignorant of the consequences of the disease when left to itself or by those who are trouble-makers. I have confidence in mankind enough to think that, where the inspectors are apiarists, with the right kind of feeling toward this great and interesting industry, not one in twenty will be found who is doing this inspection for the material benefits derived. An inspector who does his duty is sure to find opposition. In all civilized countries we find neighbors who do not get along together. Sometimes each of these two parties owns bees in an infected district. The inspector may find one apiary contaminated, and order it destroyed, while the other is in splendid condition. This at once leads the first to accuse the inspector of being partial in his methods. Of course, circumstances like the above are rare, but still they exist.

In my opinion the worst hardship the inspector is confronted with is the enforcement of the law when opposed by some influential person. It is not a pleasant duty to start proceedings or legal action against an offender of the statute, as it necessarily calls into court parties as witnesses who rather shrink from the duty, thinking that, perhaps, they may create an enmity with the one they testify against, as often happens.

If any party owning bees does not know the character of the disease supposed to exist in the hives, and after an examination by the inspector still doubts or questions the ability of the inspector in determining what is wrong, and requests that he be allowed to retain a sample of the diseased comb to submit to the government experts for an analysis, he immediately blocks any possible attempt of the inspector to do him an injustice. This kind of test would at once vindicate or convict the inspector of unfairness; and it is not expensive nor unfair to the inspector. I for one gladly submit to such a test. There is a possibility that, in some cases, it might be unfair; but in most instances I believe that it would be of material benefit to the inspector; for, after a few such tests, it could easily be shown that the inspector is either using unlawful and malicious methods or giving a square deal.

It is my further opinion that a State law, providing for a State inspector, whose salary and expenses would be paid directly out of the State treasury, would have a tendency to eliminate a lot of the prejudice against bee-inspectors, as it would do away with all county or district lines, and the duties of the inspector would not be confined to his own immediate vicinity or neighborhood.

I do not believe in drawing the party line when it comes to bee-inspectors, as I consider it poor policy to mix politics with so important an issue as the eradication of foul brood. A bee-inspector should be selected and appointed upon his merits and knowledge of the diseases of bees, and

not upon his political influence. I believe Wisconsin has the best and most efficient law relative to this subject, and the bee-keepers of that State should be proud of the law and proud of their capable and splendid inspector.

College View, Neb.

## BEE-KEEPING IN JAPAN.

### A Description of the Bees, the Climate, and of the Sources of Honey.

BY J. HOBBS.

The oldest record on bee-keeping in our history brings us back to the reign of Emperor Kogyokee (600 A. D.), when Prince Yoha, of Korea, came over to our country and let his four hives of bees fly at Mt. Miwa, in the province of Yamato. This is the first historical record we find on bees; but it is not clear whether we had bees before that. Bees in Corea are said to be a little smaller than ours, and those of Manchuria to be a bit larger. Perhaps all kinds of bees in the far East are from the same original race.

From time immemorial people have practiced bee-keeping in different provinces. The most noted ones are Kii, Shinano, and Kyushu provinces. So the hives kept and honey produced in these regions were considerable. But the way of keeping bees is not improved at all. They use empty boxes or casks to put the swarm in, with no design of conveniencing the bees. In the autumn they open these, cut off the combs, put them into bags, and squeeze out the honey contained. The poor bees brushed off are left with no stores for winter. Often they leave some part of the combs for the bees. It is the habit of the Japanese bees not to store pollen for the winter; and as their queens cease to lay late in autumn the honey squeezed out does not contain so much juice of pollen and brood; yet the color is very dark, with a disagreeable flavor. Some practice what they call a better way—cutting off the combs and setting them out in the sun, which will melt the wax and let the honey run out. Some cut off a part of the comb with honey only, and press them in bags. These are considered fine honeys, and sell high.

We do not use honey as food, except farmers living in mountains too far from any villages to get sugar. Our people consume honey in medical use largely. Most of our people do not know honey as food nor sweets on the every-day table.

Though bee-keeping is in such a state, it is quite interesting to know that the bee-keepers in the province of Kii have practiced migratory bee-keeping for ages, keeping extra queens to replace the unprolific ones. Movable frames were known to some of our people more than twenty years ago; but the nature of our bees didn't fit the improved hives, and poor results followed everywhere, and the use of them stopped generally. There are nearly 100,000 hives in our country, with an average of from 10 to 15 pounds of honey.

Mr. K. Aoyagi and others saw the defects of the native bees, and the necessity of importing European bees to our country to make bee-keeping succeed. But their idea did not work well until Mr. Aoyagi succeeded in importing Cyprian

bees. About 40 of them were scattered from his hand in different parts of the empire, besides 35 colonies which he is wintering now. Through his efforts people began to see some profit in the so-called improved bee-keeping. Some of our rich men and nobles began to be interested in it. Among them are Count Matsukata's son, Baron Iwasaki, Dr. Nagoyo, and others. In the near future our people will see the value of honey as food and take interest in bee-keeping. The Bee-keepers' Union, Tokyo, under the supervision of Mr. Aoyagi, has at present about 250 members. The Union is making steady progress, making the highways in bee-keeping by publishing a monthly journal, explaining improved bee-keeping to the members.

Let me explain some thing about Japanese bees. They are gentle, but reckless and timid, getting up a stir whenever we handle them. This is one of the principal reasons why they are not fit for the removal of frames; because as the hives are easily opened, every time they get into a tumult a poor result ensues. They love their queens too much, and like to be gathering too much. This is the reason the use of supers is decidedly impracticable to them. They are very sensitive, too, so they work well as far as the condition of hives is all right; but if they find something in the hive they do not like they cease to work, and run away. They are a hardy race for winter, but fear the heat in summer; they are weak in defending themselves against moth; so if we neglect this in summer, or in case of too much moth trouble, they leave the hives. They never accept foreign queens, and this is the reason of our difficulty in improving bees. The cells are a bit smaller and the walls weaker than those of European bees, so the foundations we get from your country are not liked by them, and sometimes they build drone combs on your worker foundation. The queens are quite prolific, but good swarmers; and when they swarm they gather on trunks of trees 15 to 20 feet high, giving us trouble in catching them.

These are the principal defects of our bees, and it is the cause of the unprogressive state of bee-keeping here. We find it impossible to get a good result in bringing forth a great income from our native bees—simply too much trouble and too little gain. If I could give five points on our bees it is their gentleness, as we never use a smoker, veil, or gloves, and their diligence and quickness of flight.

#### THE CLIMATE.

As you know, our country stretches along from southwest to northeast, with the Pacific on the southern side and the Japan sea on the northern. Formosa, the southernmost island, is very hot, while Hokkaido and Sagalien are cold, with deep snow and ice during their long winter. But the mainland, with the two great islands of Kyushu and Shikoku of our island empire, is in the temperate zone, is moderate in winter, which is comparatively short except in those parts facing the Japan Sea, where snow comes deep in winter. Hakone, where Mr. Aoyagi has his apiary, is the summer and winter resort, both for foreigners and natives. Surrounding mountains and hot springs everywhere in the ranges make the place more charming. The winter we have here is very moderate—with only a little snow occasion-

ally during winter, and the thermometer rarely goes lower than 32 (indoors). The province of Kii, noted for its bee-keeping from olden times, is warmer than here. So you can see that we are much favored in our bee-keeping so far as the climate is concerned.

#### THE PLANTS AND FLOWERS.

As for the honey-plants, we can not say which is the principal one, like clovers and basswood in America. Each province or region has its own trees and plants cultivated, such as apples, pears, peaches, oranges, persimmons, buckwheat, beans, and others. Moreover, as our lands are so thoroughly cultivated for different plants and vegetables we are not able to plant a honey-field on such a large scale as you do. But besides these cultivated plants we can have a great quantity of wild ones along the mountain ranges which run from one end to the other as if they were a backbone to our long island empire. So when we go to Kii, Shinano, and some part of Kyushu, we find many old-style bee-keepers who have colonies by hundreds. Generally speaking, our country is abundant in flowers and fruit-trees as well as plants and grasses. From nearly all of them we can have a honey harvest.

The time will soon be here when you will find a bee country in the far East among its beautiful sceneries. We hope, in the near future, to have our people of every class tasting honey at tables. We are praying for the time to come very soon when thousands and tens of thousands may enjoy this high, peaceful, profitable, and interesting business. May these little busy angels reveal the mysteries of His mighty works, and enlighten the spiritual darkness of the heathen nations of the East.

Hakone, Japan.

## HEADS OF GRAIN

### FROM DIFFERENT FIELDS

FULL PARTICULARS ON HANDLING BEES BEFORE AN AUDIENCE.

I should appreciate it very much if you would describe the handling of bees in a wire cage, before an audience, from the time the operator enters the cage until he leaves it. How do you scoop them out of the dishpan without being stung? I tried scooping them off a sheet, as I was hiving a swarm this summer, and I never had any desire to repeat that trial. What would be a fair price to ask for performing this in a local vaudeville theater—that is, how much for each performance?

What is the largest crop of comb honey that you know to have been secured from a single colony, any locality? also extracted? Where was each secured?

L. R. HENLINE.

Towanda, Ill., Aug. 8.

[The secret of handling bees by the handfuls before an audience depends on three things: First, the bees must be thoroughly frightened—that is, forced into a state of panic. This may be effected by blowing a little smoke over the top of the hive, removing the frames in the regular way, and then shaking the bees off the frames

into a large dishpan. The pan should then be shaken something like a corn-popper, causing the bees to be mixed up in endless confusion. In this state they are thoroughly frightened, or, perhaps, to put it more exactly, the colony spirit and thought of defense have been thoroughly taken out of them.

The next important requirement is absolute fearlessness on the part of the operator; and the last is the quiet, gentle moving of the fingers under the bunch of bees in such a way as not to cause any pinching. The hand must be moved so slowly that it will gather up the bees in such a way that the movement will be almost imperceptible to the audience. One can then scoop the bees up by the handfuls, scatter them all over the bare arms, and on top of his head. It seems to make but very little difference what the strain is. But throughout all of the demonstration the operator must be exceedingly careful not to pinch or rudely push a single bee or he will suffer for his carelessness.

At a demonstration given at our home yard before a company of 200 schoolteachers we showed how the bees could be handled like kittens. One of our men, observing how easily we performed these stunts, attempted to do the same thing. He pushed his hand into the cluster of bees and received nearly fifty stings. But he had good nerve, and went through the "performance." On questioning him afterward we found he pushed his hands into the cluster too rapidly, rudely brushing and shoving the bees. If one shoves his hands through the bunch fast enough to crowd the bees unduly he may get stung very severely.

If we remembet correctly, 400 pounds is the largest amount of comb honey taken from a single colony, but we do not now know the locality. Probably 750 lbs. is the largest amount of extracted honey from a colony, and this was produced in Texas.—Ed.]

#### WHY DID THE QUEEN FAIL?

We have just removed one of our own bred queens that commenced to lay June 16, laying all worker eggs only. To-day we find no unsealed brood at all, but sealed worker and sealed drone brood in worker-cells, the latter predominating. The queen, when removed, was small, with no trace of eggs when killed. The colony had been well stimulated when the queen commenced laying. This is a rare exception with us; and although queens will occasionally degenerate into drone-layers, having laid worker eggs previously, it could, perhaps, be obviated if the cause were known. Do you think a slight sting from a worker would cause the destruction of the laying organs? The queen mentioned was destitute of a foot on the second right leg.

Hemlock, O., Aug. 22.

P. BIESEMAN.

[Some of our best queens will turn drone-layers. In rare instances a queen will lay worker and then drone eggs exclusively, and, after a month or so, lay worker eggs again. In the last-mentioned case there must be some functional difficulty. In the other, where the queen turns drone-layer, and stays so, she may have at one time been chilled; she may have been pinched, or she may at the time have been fertilized by an impotent or poor drone. A microscopic examina-

tion of her after she has been dissected might reveal the cause. A long journey through the mails sometimes makes a drone-layer out of a good queen. As a general thing, we can only guess at the cause.—ED.]

#### AN ADJUSTABLE STORM-DOOR.

*Mr. E. R. Root:*—After reading your article, p. 353, in regard to storm-doors, I should like to call your attention to my chaff-hive storm-door attachment, which I think is far better than the Halter arrangement. Briefly speaking, I have an inset about 4 inches square and 3 deep in the front of the chaff hive. On the outside of this inset is the adjustable storm-door. This door is cleated and beveled on top. In the center of this door is cut a slot 2 inches long for a big-headed screw, so by shoving the door up or down we may have a space 2 inches by 1 inch by  $\frac{1}{2}$  inch, or close up entirely. Just give the screw a turn, and it will hold the door in any place, or turn it bottom up and it is out of the way entirely. My

hives are mostly packed in winter boxes, but I bridge over the projection of the bottom-board 4 inches high, which makes the inset. Two of my hives were closed up all winter. I opened them March 12, and the bees came out with a rush all in good order, and ready for business. I lost no bees last winter. I usually winter about 100 colonies.

E. N. WOODWARD.

Hillsdale, Mich.

[One objection to your adjustable storm-door is that it provides a square opening through which mice may enter unless it is closed nearly down. It would be much better to have the opening only  $\frac{1}{4}$  inch deep, by a maximum of 8 inches wide, say, but adjustable as to the width. This would prevent the entrance of mice, either when it is wide open or nearly closed.—ED.]

#### SEALED COVERS PREFERRED.

On page 369, March 15, L. E. Scherer says that absorbent cushions are better than sealed covers. I agree with the editor. When I packed my bees last fall I packed half with a Hill device on or over the frames, and an absorbent cushion on top, and the other half with a honey-board right over the frames for the bees to seal down, with about eight inches of fine straw or chaff on top.

When I was out among the hives to-day (Mar. 23) I could plainly see the difference. All the colonies that had a sealed honey-board started to work, while the bees with a piece of burlap over

the Hill device, with the same amount of chaff on top, were not active.

The reason I wanted to try this experiment was that, the winter before, I found that the chaff on top of the burlap would hold moisture, and freeze. This has a tendency to keep the bees back, even when warm weather does come. With the sealed covers the chaff stays dry.

Could I wire my brood-frames if I use starters only? Will the bees imbed the combs as they work down?

WALTER M. ADEMA.

Berlin, Mich.

[Your experience in regard to sealed covers and absorbing cushions is quite in line with reports that we received from many bee-keepers some few years ago when these experiments were being conducted. There are times when the absorbing cushions seem to give a little better results; but taking one year with another, in the average locality, the sealed cover with dry packing on top will give better results. Yes, you can wire frames, using only starters.—ED.]

#### DOES HONEY FROM POISONOUS PLANTS KILL BROOD?

In the fore part of this summer, bees near Joliet, Ill., were very badly affected by dead brood. We have some of it here also, commencing about the middle of May and lasting about eight weeks. About one-third of the brood (mostly in colonies of a dark strain) dies when about half grown. Would the honey gathered from a poisonous plant be likely to poison the brood? The plant itself and the fruit are poisonous.

I have devoted five colonies this summer to finding the cause. I have taken their brood-combs away three times, and still one colony is a little affected. Can you give us the cause?

Niles, Mich.

C. B. FRITTS.

[Honey from a poisonous plant that does not kill the adult bee will often kill brood; in fact, the brood will die in various stages long before the bees are affected.

Sometimes the liquids that are used to spray fruit-blossoms kill the brood and not the bees; at other times the spraying-liquids kill both bees and brood.

Next year, when this poisonous plant begins to yield nectar, send us some flowers, stalks, and leaves, and we will investigate.—ED.]

#### INTRODUCING QUEENS BY PLACING THE CAGE AT THE ENTRANCE.

In reply to the first Straw, Aug. 15, I will say that during the last eight years when I introduced queens I moved the brood-chamber with all the brood to another stand, and placed the second story at the bottom on the old stand, and put the queen-cage on the bottom-board at the entrance, and set a board leaning against the front of the hive to keep rain off. This gives the bees a chance to get at the candy at once.

I have never lost a queen in this way. I introduced two this year to weak colonies when there was no honey coming in. By every other way I have tried I have lost more or less. I lost as many as five queens at one hive, and then I smoked the bees till four quarts fell on the bot-

tom-board as though they were dead; but they accepted the queen after that.

WILLIAM C. PETERSON.

Canaveral, Fla., Sept. 9.

[Entrance introducing can be practiced during warm weather. There is no merit in the plan except convenience. The fact that you lost queens when you introduced in the center of the cluster was due to some other cause than to the position in the hive. It is a waste of time and money to attempt to introduce to a colony that has killed two queens in succession. Make sure it is queenless and has no laying workers by giving a frame of unsealed brood; then give it a ripe cell.

In the case cited where you lost five queens, the bees must have had something that they recognized as a queen. When you smoked them nearly to death you probably killed that freak queen, and, of course, after that you succeeded in introducing a good queen.—ED.]

#### VESTIBULED ENTRANCES FOR WINTER.

I notice the vestibuled entrance described by Mr. McIntyre, page 97, Jan. 15. The drawing gives an idea of the kind of bridge I use for this purpose. It is set in, without nailing, between the hive and the case, with the high or open side next to the case, and the low side to the hive. There is an opening four or five inches deep, and the width of the entrance, in the case, and the front of the bridge is made a little deeper than this. The opening at the back of the bridge,

which is placed against the hive-entrance, is made an inch deep—a little more if desired. This arrangement allows the packing to come down close to the entrance, and leaves room to work from the outside.

To protect the entrance a board with the lower edge cut away, or rabbeted, is hung over it with the rabbeted side next to the case, and just high enough to leave about  $\frac{3}{8}$ -inch passageway. Mice can not turn this corner—can not even chew at it—and it allows air and bees to go through, and shuts out drafts and light. When snow comes, a board is leaned up against the front of the hive.

I might mention that Mr. Storer, of Lindsay, Ont., makes a hole  $\frac{3}{4}$  inch or one inch in diame-

ter in the center of the front of all his hives, and a corresponding hole in the case, with a connecting tube or some other arrangement to prevent the packing blocking the aperture. This is in addition to the regular entrance. It looks like a lot of entrance, but he claims he has not lost nearly as many colonies in winter since adopting the plan. It certainly does away with danger arising from entrances clogging.

Richards Landing, Can.

J. R. HAND.

[The arrangement you show we consider to be very good, especially as it allows the live bees to get rid of the dead ones very easily. But this kind of storm-door should be put on very early in the fall so as not to confuse the bees on the first warm balmy day when they take a flight either in the fall or spring. To put it on after cold weather sets in would cause trouble.—ED.]

#### HOW TO CLOSE HIVES FOR MOVING; GETTING RID OF ANTS.

Wishing to move some of my bees, I have been puzzling how to make the bottoms secure with as little trouble as possible. A very simple solution of the difficulty finally occurred to me. My hives are fitted with the metal-roofed cover and super cover. Having already tacked screen wire over the tops of the hives, I removed the bottom-boards and substituted the super-covers. That made the hives as tight as a box. Then, turning the metal-roofed covers upside down, I set the closed hives in them, and dropped in blocks to keep the hives from slipping on the super cover. They were then perfectly secure for the whole trip. To shade them from the sun and to give ventilation I laid sticks across, and on them old window-shutters.

When I opened the first hive at the destination I learned that the bees were suffering for water—a contingency I had overlooked. I sprinkled the other hives before opening, thus both giving the bees a drink and cooling them off somewhat. The next time I move bees I will take along a jar of water and a rag, and give them a chance to drink along the road. All that will be necessary will be to soak the rag in water and lay it on the screen wire that covers the tops of the hives.

When ants get to bothering a hive I mix some powdered borax in strongly flavored honey in a saucer. Cover the saucer with coarse wire netting so as to exclude the bees, and set it under the front-board of the hive. That settles the ants in short order.

B. C. AUTEN.

Carthage, Mo., July 28, 1908.

[It is always advisable to carry water on hot days when moving bees. Where the bees cluster very closely over the wire cloth so as to shut off ventilation from the others, sprinkle them. This will drive them back, cool them, and prevent suffocation. A wet cloth laid on is not as good as a spray thrown on.—ED.]

#### PAPER-COVERED HIVES.

I have been using paper the past two seasons, and find it good for this locality, though we have not had much zero weather here for the past two winters.

J. L. VAN BUREN.

Madison, Ind.

# OUR HOMES

By A. I. ROOT

I the Lord am a jealous God, visiting the iniquity of the fathers upon the children of the third and fourth generation of them that hate me.—EXODUS 20:5.

Let me repeat just once more (the thought first mentioned in our issue for Sept. 1, and again Oct. 15) what I said about marriage being the most sacred and solemn event between birth and death in the life of a human being. Although I have lived, and observed humanity for nearly seventy years, I did not know until recently that breaking God's holy command not to commit adultery frequently sends men and women to insane-asylums—at least I did not know, or had not considered, that even a *young* man may in three years become a *raging maniac* simply by transgressing the law of God and also the law made by man. Many young people seem to think it a light thing, or a thing of not so *very much* importance, that they should live pure chaste lives, and that, as only marriage sanctifies this holy union between man and woman, there should be no trifling in the matter. The world demands that a woman shall be pure; and may God help us in a like manner to demand that the young man who proposes marriage shall *himself* be pure.

In a recent issue of the *Cleveland Press*, one of our regular dailies of a great city, I was startled by an editorial that I believe should have world-wide publicity. Read it over; and when you get through it, read it again. Yes, I wish every man, woman, and child could read it and ponder over it a dozen times. You may be tempted to think it is an extravagant statement; but after you have read it and considered it, look out on humanity and then pray over it, and *then* I think you will conclude it is just right. Here it is:

## REAPING WILD OATS.

Can you imagine what would happen to a man if he were pointed out on a crowded street and a voice cried loudly, "That man has just taken a white hot wire and put out both the eyes of his day-old boy?"

Suppose a man did such a thing—with a white-hot wire. No voice would be raised to ask mercy. If he escaped a rope at the hands of a mob you may be sure the judge and jury would see to it that he got the limit of punishment allowed by law.

Away back when the world was young, human beings toiled patiently to work order and civilization out of chaos. One of the first things attempted was to throw the safeguards of social convention, religion, and even superstition about the marriage relation. Chastity in a woman became as vital to her as a member of civilized society as life itself. And woman accepted the decree as wise and just, and she has, a million times, defended her chastity at the cost of her life. And man, having worked out the self-evident proposition that the life of the human race depends upon the sanctity of marriage and the purity of its participants, had shown himself again to be higher than the other animals—no longer a beast, but a man. Then man rejected his own wisdom, and permitted himself and his son to relapse to the level of the beast while insisting that his wife and his daughter, as they value their lives, maintain the high position that reason and intelligence point out.

In the old days the male human was a queer mixture of a thinking creature and a brute. His new-developed mind thought out and laid down rules and laws—for other people—and his animal instincts (the instincts of a bull moose) guided him largely in his own conduct.

The man made the women-folks accept the decree of chastity: himself he absolved. The lord of the manor made his tenants and vassals toil: himself he indulged in idleness. The king enforced economy and prudence upon his officers: himself he permitted luxury and extravagance. The great captain enforced sobriety upon his soldiers, and in many cases the *great general* of early history was the *great drunkard*.

Then the phrase "sowing wild oats" was invented. It was coined as an excuse for the inexcusable; a cloak for the naked truth; a cowardly bluster to hide craven conduct. "Sowing wild

oats" was accepted and acceptable in the state of society in which it was coined; but it's as much out of date now as is chain armor or curing disease by witchcraft. The thing we want to know about now is *reaping* wild oats. Whose is the harvest? and by what right is such a harvest sown for an innocent reaper? and what is that harvest? Listen:

One out of three of the babies who are blind at birth, or whose little eyes flicker and go out in the first few days of life, are reaping their fathers' wild oats.

Two out of three of the women who lie under the surgeon's knife for operations peculiar to women are reaping their husbands' wild oats.

One-half the homes in which no baby's voice will ever be heard are sterile because of the husband's wild oats.

Countless thousands of babes are born dead, and the little life is the toll of father's wild oats.

Millions of babies, of boys and girls, youths and maidens, men and women, go through life sickly, miserable, unsound in body and mind, and they are reaping their father's wild oats.

Oh! We mustn't talk about such things in public? Well, then, let it be known that the phrase "Hush! such things must not be talked about," is of the same cowardly stamp as the apologetic "sowing wild oats." These things must be talked about until we realize that a pure girl deserves a pure man. No young man "must have his fling" if that "fling" takes toll of his future wife's health or his baby's eyes.

Not talk of it! Think of a baby groping its way in the eternal darkness of the blind; think of the young wife poisoned at the very altar of marriage; think of the cost of that crop of wild oats, and then say whether the subject is a proper one to discuss.

Does not the father ask if his daughter's suitor is able to support her? Does he not ask if his mind is clean, and fit for fatherhood? Then why not ask, and insist on knowing, if his body is clean?

When I was in Florida two years ago I experimented considerably with a cheap incubator. It brought out some chicks, but a good many of them were crippled. Mrs. Root said at once that the Humane Society should stop people from using an incubator that brings *cripples* into the world. She said nobody should be permitted to curse deliberately even the dumb brutes by bringing into the world a lot of cripples, and I agreed with her. I think that, at the time mentioned, I said something about human beings being permitted to people the world with human cripples. That figure of putting out the eyes of a "day-old" baby with a hot-wire startles one. It is too horrible to think of. Of course, we have asylums in our land (and may God be praised for them) to take care of those who are born blind; and we have also asylums for those who are crippled in other ways; but I must confess again, old as I am, that I have never noticed statistics particularly in regard to this matter from those who are blind or crippled from birth, and how it came about.

When this writer in the *Press* told us that one out of three babies that are blind at birth are so as the result of their fathers *sowing wild oats*, I thought it could not be true. Again, everybody has wondered why women require so many more surgical operations than men; and I wonder if it can be really true that it is the fault of the men (or of the wretches who *call* themselves men) who marry these good pure women.

Then, again, just recently my attention has been called to so many childless homes that I began thinking it must be a severe cross—yes, we might say a *terrible* cross—for both husband and wife to go through the world having no children to gladden and brighten their home. This writer says *half* of these cases are occasioned by the husband's stupid folly, or, better still, *criminal* folly, and that the world is peopled with crippled beings because of the awful selfishness and greedy spirit of men who have never learned to control themselves, or, better still, to control their passions.

Several times in our Home papers we have had a little talk about overcoming. There is a whole string of promises in the book of Revelation concerning those who overcome. Here are some of them: "To him that overcometh will I give to eat of the hidden manna;" again, "He that overcometh, and keepeth my works to the end, to him will I give power over the nations;" again, "He that overcometh, the same shall be clothed in white raiment;" again, "Him that overcometh will I make a pillar in the temple of my God;" and, finally, "To him that overcometh will I grant to sit with me in my throne, even as I also overcame and am set down with my Father in his throne."

I once heard a minister say, up in the backwoods of Michigan, that this last promise meant that God wanted a lot of good men to counsel with him in regard to the affairs of the universe. Every man who occupies an important position in this nation of ours has about him, or ought to have, some good wise men to advise him and counsel with him; and this backwoods preacher had the audacity to say that even *God* needs help and counsel from human beings; and he said that those who had learned to overcome all selfish and wrong feelings were going to sit with God on his throne, and receive a commission from him to *help* him do his work. Now, you can take the suggestion for what it is worth. One thing we know is that God does need the help of good men in this world of ours. I do not know as yet what he will want us to do in that great unseen and unknown world.

While I was considering whether that statement in the *Press* could be absolutely true, our Medina people were favored by a lecture from Dr. N. C. McCormick, of Bowling Green, Ky.—a physician of world-wide reputation. Well, this doctor gave us the statistics and illustrations from all over the world, corroborating every point made by the editor of the *Press*. He said that the sin and suffering and pain and death of the present age are due, at least to a very great extent, to brutes in human form, many of them, it would seem, who never ought to be permitted to live.

May God be praised for the temperance wave now spreading over the whole world, that promises to eliminate such hellish work and stop to a great extent this matter of bringing cripples into the world, and children born blind.

Now, do not think that I am condemning everybody else, and holding myself up as a pattern of what a man should be. God forbid. When I was a boy (I am ashamed to tell it) my boyish mind was poisoned by evil associates to some extent, and by bad books to some extent. Thank God, that, through Anthony Comstock's indefatigable labor, bad books have been mostly banished. Mind you, I do not say my *body* was poisoned, for my good father and mother watched over me too closely for that; but when I was getting toward marriageable age I rather enjoyed the fun, as I called it then, of persuading—that is, to a greater or less extent—any bright girl whom I came across to think (perhaps in pleasantry) that *she* was to *me* the center of the universe, or was at least for the time being. It was what we used to call at that time "having fun with the girls." Some of us had fun with several different girls at a time. When I became ac-

quainted with Mrs. Root, however, she gave me to understand that, if I proposed to call on her regularly—that is, in a way that would attract the attention of people to the matter—that I could not at the same time keep up similar relations with other girls. She said I was, of course, at perfect liberty to do as I pleased; but if I continued to call on her as I had been doing, I would have to make a choice. Now, I remember distinctly of thinking at that time that I would rather not get married, even if I *was* of marriageable age. I thought I could have more fun, and get more enjoyment out of the world, without being "hitched up for life" to *any* special woman. May God forgive me for letting such a thought come into my mind.

By the way, friends, let us consider this thing a minute; and I wish to speak now particularly to men say between twenty-five and forty years of age. Why did God send you into this world? Was it to get all you can out of it for your own particular *self*, to have *fun* with every thing, say with some pretty girls or some nice bright intelligent woman and all the rest? If so, you do not deserve a human life; and if you follow out that selfish course you will never find any *true* happiness. It is the people of that class who commit suicide. Ernest has often laughed at me for my fashion of asking every bee-keeper, or anybody else with whom I become acquainted, if he is married and has a family. But I still think I am right, that every good man *should* be a married one. A minister has no business being a preacher, and I do not think he ever *becomes* very much of a preacher in God's sight (and I hope he does not in the sight of humanity), until he is married to some good woman or has some good woman in view, and lets everybody know that he *expects* to be a married man. I do not care who this hits, for I am sure I am right about it. And the same thing is true of a doctor. There are some greater reasons why a *doctor* should be a married man than perhaps any other professional man in the world. How can a doctor take up his work of helping humanity as he *ought to do* until he has a wife and children?

The article that I quoted from the *Press* tells us that it is the fault of the men themselves in half of the childless homes for having such homes.

Let me put this matter of going through life without marriage in another way. I recently met an old friend of many years ago—a good man and an able one—and yet he is not a married man. I said to him, as I stood before my two sons, Ernest and Huber, "Mr. A., I regret to know that you are still unmarried. Now, suppose I had done as you have done, and yielded to that selfish temptation to go through life without marriage; then these two good men who supply reading-matter for our journal (I am sure our readers will excuse me when I say this) would never have had an existence."

The editor of the *Press* spoke about burning out the eyes of a day-old babe with a hot wire, and we shudder at the thought; and I believe all mankind agree that it is a crime, and a *terrible* one too, in the sight of God and man, to murder these little innocents even *before* they are born. Well, how about the man or woman who refuses to give these little innocents even a *chance* to live?

A good friend of mine, who at that time lived

in the city of New York, said people who live in flats do not have children. The proprietors of these places for homes will not rent them to a family with children, for they do not want children around. Suppose George Washington's parents had decided they could have more "fun" by not getting married at all. May God be praised that Washington's parents were not of that stripe; and, to come down to the present time, suppose the parents of *Orville and Wilbur Wright* had decided they did not want the trouble and care of a family. President Roosevelt has many times reminded us of the consequences of being content with childless homes or living unmarried. He calls it "race suicide." Do you say that the illiterate foreigners, or even the shiftless people of our own land, will furnish children enough? Yes, so they will, probably; but who will furnish the money to build the asylums and jails and prisons to care for these children?

Here is another clipping that I wish to give you, from the *American Issue*:

#### SCIENTIFIC TEMPERANCE SCHOOL CHARTS.

A number of scientific temperance school charts, which are being used in a large number of the public schools of the United States, have aroused a storm of protest on the part of the liquor fraternity because of the terrific arguments against the use of intoxicating liquors which these charts set forth. The charts were carefully prepared by scientific experts; and the facts which they set forth are, while startling, the results of the most thorough scientific investigations.

Dr. T. Alexander Nicholl, of New York, prepared the statistics on heredity, which are shown on these charts with telling effect. The records show that one French and English family of moderate drinkers, in well-to-do circumstances, had 33 descendants. Of these, only 3 were normal. Two of the remaining 30 were suicides; 3 had suicidal mania; 3 were confirmed drunkards; 4 were prostitutes, and 18 had tuberculosis.

Another record, of 76 families of moderate drinkers, with 236 descendants, shows that only 50 were normal. Eight of the remaining number were insane; 21 were confirmed drunkards; 8 were idiots, and 149 had organic disease or neurosis.

Still another record shows that in 24 families of hard drinkers, with 113 descendants, only 20 were normal. Of the remaining 93, 16 were drunkards; 7 were epileptics; 8 were dwarfs; 7 were idiots, and 55 had organic diseases.

The other statistics which these charts show, secured by the investigations of Dr. Demme, show that of ten temperate families, with 61 children, 50 were normal, 5 died in infancy, and only 6 had organic diseases.

Another investigation shows that of 31 families of abstainers, with 116 descendants, 96 were normal, 19 had organic diseases, and one was a drunkard.

The mortality figures shown by these charts are also very interesting. The investigation shows that, of 100,000 moderate drinkers, 44,000 reached 70 years of age, and 45,000 died before 70. Life-insurance companies figure that the lives of beer-drinkers are shortened from 40 to 50 per cent.

The charts further show that 88 per cent of the manufacturers of the United States demand total abstinence on the part of their employees, and that about 1,000,000 of the railroad men of the country are compelled to be total abstainers from both fermented and distilled liquors.

As a further illustration of the preceding we copy the following from the "Anti-saloon League Year Book" for 1908:

#### DESCENDANTS OF A DRUNKARD.

Pellman, of the University of Bonn, tells of a very notorious drunken woman who died in 1800. A scientific investigation made regarding herself and her descendants has brought forth the following astonishing facts:

The total number of her descendants was 834. Of that number, 709 have been traced, with the result that the record shows that 7 were convicted of murder; 76 were convicted of other crimes; 142 were professional beggars; 64 lived on charity, and 181 of the female descendants were prostitutes. It has been estimated that the cost to the government of the crime and pauperism of this one line of descendants has been \$1,250,000.

And also the following from Dr. J. H. Kellogg's "Handbook of Rational Medicine:—

Dr. S. G. Howe attributed one-half of the cases of idiocy in Massachusetts to intemperance, and he is sustained in his opinion by the most reliable authorities. Dr. Howe states that there

were seven idiots in one family where both parents were drunkards. One-half of the idiots in England are of drunken parentage; and the same is true of Sweden, and probably of most European countries. It is said that in St. Petersburg most of the idiots come from drunken parents.

Perhaps I should state that Dr. Kellogg makes the above statements as a quotation from Dr. Willard Parker, of New York—one of the ablest writers on this subject the world has produced.

In closing, May God grant that this Home paper may be the means of waking up good men, and I hope you will excuse me for saying some good women as well, to the importance of doing what they can to fulfill God's command to humanity away back in the beginning of the world—"Be ye fruitful, and multiply, and replenish the earth."\*

Perhaps some of you may suggest that, if you get married, it might be the means of bringing crippled children into the world as I did with my chickens in the cheap incubator. God forbid. If there are such whose eyes rest on these pages, or any who think that ill health unfits them for marital responsibilities, then go to work this minute, and *make yourself well*. T. B. Terry is telling us how it can be done, and thousands are coming forward as witnesses. This learned doctor who gave us that talk said it is a disgrace to have typhoid fever in any community, and that the time is fast coming when the same can be said of tuberculosis—that the great white plague is going to be fought out and banished; and I am sure there are very few men or women who read these pages but can, if they take sufficient pains, in a few years succeed in securing a degree of health that will permit them to think of raising a family with a very small liability of bringing *cripples* into the world. We are going to have a better "strain" of men and women than the world has ever yet known, and we are going to improve on the human family just as much as we improved on our horses, cattle, pigs, and chickens. God help us. My good friend Terry has finally yielded to my importunity, and is going to write a book this coming winter. May God guide and direct him, and give him health and strength to do it well.

## TEMPERANCE

OUT OF THE DARKNESS AND INTO THE LIGHT;  
TURN ON THE "SEARCHLIGHT."

I hardly need tell our readers that just at this time Ohio is in the heat of the battle that righteousness may prevail over iniquity. To give you a little illustration of the brazen cheek and effrontery of the enemy, let me mention the fact that our neighboring county of Lorain has just had a vote on county option. Oberlin is in that county, and Oberlin is known the world over as a great center of learning and a radiating source of moral reforms. A big part of Lorain County

\* I clip the following from the *Farm Journal*, of Philadelphia:

They say that happiness is found only in the dictionary; but it seems to us that an honest young man, married to a healthy, happy, truly Christian girl who loves her home, comes just about as near human happiness as ever mortal gets; and such a man will not be so ungrateful as to swear, get drunk, or do a cruel or mean act.

To all of which I wish to give a hearty *amen*.

was thoroughly canvassed, and we were abundantly satisfied that a fair vote would make the county unquestionably dry. Imagine our surprise, however, to have it reported *125 wet*. Careful investigation now reveals the fact that the little town of Avon, that contains only about 300 legal voters,\* cast a vote of *510*. In many other small towns we find a similar state of affairs. These extra votes were made up of men employed by the brewers to come in and reside a certain length of time. The matter is coming up before the courts; and the question is, "Shall our laws be made by the brewers with their money, instead of by honest voters?" We need the prayers and sympathies of the whole wide world. The outcome of this fraud in Lorain County will probably influence the result in the whole State of Ohio; and Ohio just now stands up before the rest of the United States as an object-lesson. As Ohio goes, so may the rest of the States; and, finally, as the United States goes in this matter of temperance, so may the rest of this world of ours. May God help us to demonstrate to the surrounding nations that God still lives, and hears our prayers, and that there is even *now* "a God in Israel."

Just as the above was dictated, a business letter was put into my hand from our good friend Murray—the man who has for many years made the pictures in GLEANINGS. I want to give you the concluding part of his letter:

I am sorry Lorain Co. was off color, and went *wet*, as it somehow seems to hurt our county (Cuyahoga). We had every hope that the good march would continue. I have fought the cursed rum traffic all my life, and in my early days was in the chair of both the Good Templars and Sons of Temperance, and even in the Grand Lodge of such organizations. I have even been shot at by its enemies, and was clubbed insensibly by a saloonist who was afterward sent up for a year and a half—in Massachusetts. My early life and opportunities were clouded by the evil, so you need not wonder at the hatred I have for the thing.

You will excuse me for introducing such matters in a business letter; but I feel strongly on all such subjects—not against the individuals in the business of liquor-selling, but on the thing itself. It is from hell, and produces hell. The harder the brewers kick, the worse it will be for them.

Cleveland, Ohio.

R. V. MURRAY.

Up to date, Oct. 28, 37 counties in Ohio have voted dry and only 4 have gone wet. One of the latter is being contested on the ground of fraudulent voting.

#### TEMPERANCE AMONG BEE-KEEPERS.

At our recent convention in Detroit our good friend G. W. York, whose head is always level, and who loves righteousness and hates iniquity, gave us a grand address on temperance among bee-keepers. You will doubtless get the whole of it in the *American Bee Journal*. Well, now, here is something in the same line. It is an advertisement clipped from the Zanesville *Signal*:

It's not a question of high taxes or low taxes, good business or bad business. It's a simple question of right or wrong.

No man who has a drop of manly blood in his veins will, for any business consideration, vote to retain in our midst the home-wrecking, soul-destroying saloon.

PEIRCE'S HONEY—made by the bees.

Friend E. W. Peirce is not only a successful agent for the Root Company's goods, but he is a bright young man, and I am told he is en-

gaged to be married to one of the brightest young ladies in that whole region. It was my pleasure to see her and shake hands with her, and so I think there can be no mistake in the matter. Any man who puts his name at the bottom of an advertisement like the one above is *sure* to make a good husband and to build up a good home.

## HEALTH NOTES

### THE ART OF LIVING LONG.

I hold in my hand a good-sized book of over 200 pages, written principally by a man who lived to be 102 years old; and the very best chapter in the whole book was written when he was 95 years old. Louis Cornaro was born in 1464 and died in 1566. It now seems that there have been for years past persons here and there who have been learning the great truth about controlling our selfish and sensual appetites. At the age of 40, Cornaro was a used-up man. He had wealth, ease, and leisure; but after the doctors told him they could give him no help he started in as did T. B. Terry. His first discourse was written at the age of 83. Permit me to make an extract from it, page 41:

O wretched and unhappy Italy, canst thou not see that intemperance kills every year amongst thy people as great a number as would perish during the time of a most dreadful pestilence, or by the sword or fire of many bloody wars? And these truly immoral banquets of thine, now so commonly the custom—feasts so great and intolerable that the tables are never found large enough to accommodate the innumerable dishes set upon them, so that they must be heaped, one upon another, almost mountain high—must we not brand them as so many destructive battles? Who could ever live amid such a multitude of disorders and excesses?

Please notice what he says about "innumerable dishes;" and may God forgive us as a people for having continued this suicidal fashion up to the present day. At the age of 86 he wrote his second discourse; at 91 his third discourse, and at 95 the last and best of all. He was not only brighter when he neared 100, but a happier man, and perhaps a more useful one, than he had been at any time in his life. Let me make an extract from page 111:

Who could ever find weariness in a lot so truly blessed and happy as the one I enjoy? Yet this happiness would be the portion of every man if he would but lead a life similar to the one I have led. And, assuredly, it is in every man's power to lead such a life; for I am nothing but a man and not a saint, only a servant of God, to whom the orderly life is well-pleasing.

Now, the most wonderful part of it all is that he said in his first treatise, at the age of 83, that he expected to live to be 100 years old, and he repeats it several times, and he *did* live to be 102.

The book does not give very much direction in regard to diet—that is, he does not specify exactly *what* food we should eat. He was not a vegetarian, although I think his food was mostly along that line. He strongly emphasized the importance of a busy outdoor life, but urges at every step *moderation*, especially in having only a limited number of articles of food at each meal, and stopping when we have had just enough so the digestive apparatus can handle it easily and well. Like Terry, he said it is truly wonderful what a small amount of food can sustain life; and he strongly emphasizes the fact that *elderly* people, especially when they give up hard work,

\*After the above statement (which I clip from the Cleveland *Plain Dealer* for Oct. 22) was in print I was informed that there are considerably more than 300 legal voters in Avon. I make this explanation because God knows we would not knowingly misrepresent or exaggerate in a matter of this kind.

should be exceedingly careful about overeating. A great lot of us, when we get to be sixty or more, propose to "take life easy" and let the younger folks attend to the duties of life. Then if we happen to be so unfortunate as to have little or nothing to do, we get into the habit of eating between meals of this, that, and the other, because we have nothing else to occupy our attention; and the result is a loss of health and perhaps a loss of life.

Besides the Cornaro treatise there is a selection from Lord Bacon and several others along the line of long life. There is an introduction by Joseph Addison, from the *Spectator*, dated 1711.

Here is something more in the same line, which I clip from the *Medina Gazette*, on what is called "Monday sickness."

A bulletin of the Indiana State Board of Health contains some pointed remarks from a teacher concerning the regular "Monday sickness" in the public schools. She said: "More school-children are ill on Monday than any other day of the week. By Wednesday or Thursday the attendance and condition of the pupils are up to the standard, and they stay so the rest of the week. Inquiry showed that every family had an elaborate dinner on Sunday, and that the children and parents ate more on that day and exercised less. Fourteen of twenty-seven children were found to have been 'Monday sick' almost every Monday. Acting upon the idea that the Sunday big dinner was the cause of the trouble, ten children were selected, and the parents were requested to set the ordinary dinner for two consecutive Sundays. The result was, all of the children came to school on the following Mondays, bright, and quite free from the symptoms heretofore detailed."

I may add to the above that one of the teachers of our Medina schools told Mrs. Root that there is more trouble on account of absence or sleepy children on Monday than on any other day of the week, and the cause is no doubt explained in the above. I have long maintained that, if there is any day in the week when the good wife should be excused from getting a regular dinner, that day is Sunday; and yet, be it said to our shame and disgrace, nine out of ten of our homes get up a more elaborate spread for Sunday than any other day, and I am afraid that, on top of that, the children (and may be the parents too) eat a lot of things between meals because they have nothing else to do.

I think I have before mentioned a good woman, a relative of mine by marriage, who did all the cooking for Sunday dinner the day before; and not only the inmates of the home, but any visitor who happened to be there, was obliged to put up with a cold meal on Sunday, and I hope there was nothing very elaborate about it. May God help us to climb out of our bad habits, especially when we remember that the ladder that takes us up stands on earth and reaches toward heaven.

A few days ago I suggested to friend Terry that he and I would be expected to demonstrate the correctness of our own teachings by living to be 100 years old; and I also suggested that we ought to get to work and see which will live the longer. I do not mean, dear friends, simply prolonging existence, but, on the contrary, like Cornaro, do our best for the world and for humanity when we are along in the nineties and close up to a full century. Perhaps you would like to know what Terry says about it. Here it is:

Barring accident, friend Root, you can gradually become ideally well in every way—able to do a full man's work, and keep so for many years. I intend to, and have no limit set in my mind; leave that to God after doing my part. I intend to be young at 100. By the way, let us spend the days together when we reach the 100-year mark. There is not the slightest joke in any of

this. I am seriously in earnest. It doesn't seem possible; but I shall be younger and better in every way ten years from now than I am to-day, judging from past experience. You notice Cornaro found it the same. T. B. TERRY.

Hudson, O., Oct. 15.

Mrs. Root suggested that she fears we two old men will have to run the latter end of the race without our wives if we expect to get to the 100 mark. I replied that friend Terry expects to take his wife along with him, and that, if Mrs. Root did not get contrary, I should greatly enjoy her company too up to the 100 mark. Now, we are not at all exclusive. If there are any among our readers who wish to "join the procession," come right along. The more the merrier.

P. S.—I would suggest that we "old fellows" spend our winters in Florida, providing I can persuade friend Terry to go along with me. We can thus be outdoors all day long, and I am *sure* *he* and I can find something to be busy about, and something to be *happy* about, even if we are over 90.

#### THE VALUE OF RAW APPLES.

The following, which I heartily indorse, was sent us by J. L. Peabody, of Denver, Col. I am unable to give the name of the periodical from which it was taken, but it was probably some Denver paper.

Many persons fancy that raw apples are indigestible, and enduring only in the early morning. Doubtless the old adage that fruit is gold in the morning, silver in the middle of the day, and lead at night is to some extent answerable for this erroneous impression. Dietitians say that raw ripe apples contain more phosphates in proportion to their bulk than any other article of food, fish not excepted. A recent writer on this point boldly declares that in this lies the secret of healthful longevity. They correct biliousness, and act as a sedative upon the racked nerves, and allay insomnia.

"Eat uncooked apples constantly, although, of course, in moderation, and drink distilled water only, and years will be added to your life, while the evidences of age will be long in coming."

This argument is based on the supposition that, as age advances, the deposits of mineral matter in the system increase, and that aging is little more than a gradual process of ossification.

Phosphoric acid contains the least amount of earth salts, and for that reason is probably the nearest approach to the elixir of life known to the scientific world.

If you wish to live long, retain your youth at the same time, and to increase your brain tissue, eat plenty of apples, drink only distilled water, and eat as little bread as possible. Tart apples are far more wholesome than sweet, and all, like potatoes, should be fully ripe when eaten.

#### SELLING SECRETS, ETC.

We are still at it, friends, like the Irishman who had six wives. He said, in explanation of his conduct, "Plase yer honor, I was trying to get a good one;" and we are still sending out money for secrets in order "to get a good one." E. H. Palmer, of Alfred, N. Y., says in his circular that his wonderful secret of selecting laying hens is worth \$50.00. But out of the sympathy and generosity of his heart he is selling it for only 50 cents. Before you can have this wonderful information, however, you have to sign your name to a pledge not to divulge anything contained in the booklet. There are two agreements, and both must be signed by the purchaser; and the matter is so valuable, and his "profit" so *small*, that he adds: "Personal check or draft will positively not be accepted unless 15 cents is added for exchange."

Well, I sent on my 50 cents, but I did not sign any agreement whatever. But I got the book all the same by the very first mail, as I always do. In fact, I have *never failed* so far to

get a secret, even if I did neglect to sign any contract. This wonderful book contains just four pages about the size of a postal card, and it is the old lingo right over—see page 43, Jan. 1st.

There is one funny thing about this secret business. There seem to be a good many fellows who have not brains enough to originate any thing, and so they copy some other man, thinking that these other fellows, Hogan and Potter, for instance, are making so much money in the secret business that there is no reason why they should not have some of it. Just see how many are copying the secret regarding sprouted oats—the best food in the world for chickens, costing only 10 to 15 cents a bushel. And now somebody advertises it at only 8 cents a bushel, and every time it turns out to be sprouted grains. But every man claims this as his own invention. He would not be guilty of copying (no, no) or stealing a secret from somebody else.

Let me say once more, 50 cents is a *big price* for a book of only four little pages. Mr. Palmer also advertises his great "profit-paying" White Leghorn chickens and eggs in this same *fifty-cent book*.

#### PRESIDENT ROOSEVELT AND BIRDS.

In the last issue of GLEANINGS is a clipping in which a boy, when remonstrated with for shooting birds, says, "President Roosevelt does it." The President does sometimes shoot a few game birds, but does not shoot song or insect-eating birds, and he has probably done more to preserve bird as well as animal life than any other man in the country by setting aside reservations where they are protected all the time by the Audubon Societies. By sending 20 cts. to the Macmillan Co., Harrisburg, Pa., for a copy of the October number of a magazine called *Bird Lore*, you can find out more about some of the reservations.

Wall Lake, Ia.

JOHN A. SPURRELL.

I am glad to give place to the above, friend S.; and since you mention it we ought to know that the President would not practice or encourage the slaughter of song birds or any other birds not fit for food, or which are not detrimental to fruit and crops. There are certain birds that ought to be gotten rid of. The English sparrows are not only consuming the grain provided for our chickens, but they fill our eavespouts with their excrement, and scatter it over our walks and porches unless we continually fight them away. If we are going to have pure drinking-water we do not want guano mixed in with it every time it rains. Notwithstanding all this, I feel pained when I see young boys around with bird-guns. I hope and pray that birds detrimental to crops and health may be destroyed in some other way.

#### ALFALFA.

I hope you are trying a little alfalfa—a patch big enough for your chickens if nothing more. It does not make any difference where you live: it can be made to grow all the way from Maine to Florida. Here are the directions boiled down, which I clip from the *Ohio Farmer*, written by Willis O. Wing, the great authority on the subject of alfalfa:

Please do not make a mystery of alfalfa-growing any longer. It is such a simple matter that one can write all the rules needed in small space. Here they are: Drain the water out; let the air into the soil; fill the land with lime if nature did not do it; get humus into it—stable manure or some vegetable matter to rot and promote the life of bacteria there. Put in plenty of phosphorus. Sow good seed, with a little inoculated soil. Lime brings alfalfa. Alfalfa brings corn. Corn brings money, homes, pianos, and education for farm boys.

#### THE WRIGHT BROTHERS' AND OTHER FLYING-MACHINES.

We are pleased to note that Wilbur Wright has so far recovered from his recent accident that he is going back to his home in Dayton, and probably is there at the present writing. The broken bone has made a very quick and satisfactory mend. The following, which we clip from the *Cleveland Plain Dealer*, indicates that the Wrights may soon have competition in their own town. The clipping was dated Oct. 27, and comes from Dayton.

Frank J. Heinelt to-day made a successful flight of 1500 feet with an aeroplane materially different from that of the Wright Brothers. In this machine the single-plane principle is used, while the Wright machine has double plane surfaces. Although hitherto unknown in the aeronautic world, Mr. Heinelt has built three machines, paying his expenses out of his salary as a stenographer. His motor was given him by a friend who took it out of an old automobile. The flight to-day was terminated by a lack of skill on the part of the manipulator, who brought the machine to the ground too suddenly and broke one of the wings. Repairs will be made at once. The flight was witnessed by several persons.

#### A. I. ROOT, AND HIS DEPARTMENT IN GLEANINGS.

I have been considerably worried of late, dear friends, for fear that I might, perhaps, unconsciously, as I get along in years, be taking more space in these pages than is really wisest and best. I have often heard it said that, as ministers of the gospel get older, they become lengthy and tedious in their sermons. Now, whenever that thing happens in my case I hope some good friend or friends will be frank enough to say so. The foregoing was suggested by a letter just put into my hands. Here it is:

I do not keep bees now, but can not do without GLEANINGS, as the Home talks are worth more to me than I can name in dollars and cents. Long live A. I. Root! He can not write too much. Tell him to write an A B C poultry-book.  
Somerville, N. J., Sept. 26.

L. B. THATCHER.

Many thanks, my good friend T., especially for the sentence that reads, "You can not write too much." Of late I have been using five to six pages in each issue of GLEANINGS; but when I get down in Florida, where I have no stenographer to talk to, as I do to my old and tried friend W. P. Root, it will be a harder task for me to occupy so much space.

Another thing that troubles me is that I don't seem called upon just now to say very much in regard to bee culture; but it may be that others fill that department so capably that it is not necessary for me to talk on bees. I should dearly love to write an A B C book on poultry while my mind seems to run so much in that direction. Of course, I have not had any great experience, even though I have kept chickens most of my life; but I have visited and am in touch with many of the largest and foremost poultry establishments in our country.

Now, if there are some of our readers who do not agree with Bro. Thatcher that the originator of GLEANINGS can not write too much, especially in his old age, I hope they will be equally frank and outspoken. There is one class of people who, I am well aware, are not particularly well pleased with my department; and these are the dear brothers (and I hope they will let me call them brothers) who are or have been heretofore in the saloon business; for I am and shall be, while God permits me to hold the breath of life, fighting every thing that is unrighteous.

# BOOKS FOR BEE-KEEPERS

## The Swarthmore Library.

A series of booklets on bee subjects by E. L. Pratt, of Pennsylvania, known to the bee-keeping world as "Swarthmore." These books are full of the most valuable information. The Swarthmore method of queen-rearing is spoken of as the most important innovation in bee-keeping of recent years:

**INCREASE.** The first of the series. Any one desiring to enlarge his apiary should learn the Swarthmore way. Price, postpaid, 25 cts. French edition, entitled "Accroissement," 50 cts. postpaid.

**BABY NUCLEI.** The using of little frames and a handful of bees for mating queens has created quite a stir in the queen-rearing business. From this booklet you get your information direct. Price, postpaid, 25 cts. French edition, entitled "Nuclei Miniatures," 50 cts. postpaid.

**COMMERCIAL QUEEN-REARING.** A complete description of the Swarthmore methods of queen-rearing in regard to cell-getting. Price, postpaid, 25 cts.

**FORCING THE BREEDING-QUEEN TO LAY IN CELL-CUPS.** This little book rounds off the Swarthmore system. It is the finishing touch, and ought to be read by all queen-breeders. Price 25 cts.

**SIMPLIFIED QUEEN-REARING.** Revised edition. It tells the honey-producer how to rear queens by the very simplest method ever published. Good queens for little money and little trouble. In just an effective and economical plan for the bee-keeper who works for profit. Price 25 cts., postpaid.

## Bee-keepers' Ten-cent Library.

The following books are neatly bound in attractive papers, well illustrated. Just the thing for the beginners to help them with their troubles. Price ten cents each postpaid.

No. 1. **BEE-KEEPERS' DICTIONARY.** It is often confusing to a beginner or one who is not acquainted with the literature of bee-keeping to understand the different terms used by writers on the subject. This book is intended as a reference work giving clear definitions of current terms.

No. 2. **INMATES OF THE HIVE.** We often hear, even at this late date, about the "King Bee." This book is intended to correct such erroneous ideas.

No. 3. **HONEY-COMB.** This is a little book showing the construction and development of the honey-comb, and is alike useful and interesting.

No. 4. **HANDLING BEES.** Valuable especially for the inexperienced.

No. 5. **TRANSFERRING BEES.** This book details the most practical present methods of transferring from boxes to modern hives.

No. 6. **BUILDING UP COLONIES.** Plain instructions for getting colonies into the best condition for the honey-flow.

No. 7. **THE HONEY-FLOW.**

No. 8. **SWARMING.**

No. 11. **WINTERING BEES.**

No. 12. **SPRING MANAGEMENT OF BEES.**

No. 13. **BEE DISEASES.** There has long been need of a better book on this subject. The book is written by Mr. E. R. Root, after long comparison and careful study of the writings of leading bee-keepers on the subject.

No. 15. **ESTABLISHING AN APIARY.**

No. 16. **MODERN QUEEN-REARING.** Detailing the latest methods, by leading breeders, embracing the best of several systems. We have also a French edition entitled "Elevage Moderne de Reines," and a Scandinavian edition entitled "Moderne Dronningavl," 25 cents each.

No. 17. **HABITS OF THE HONEY-BEE.** A condensed account of the life and habits of the bee in simple language.

No. 18. **BEE-KEEPING FOR CLERGYMEN.**

No. 19. **BEE-KEEPING FOR WOMEN.**

No. 21. **FACTS ABOUT BEES.** Just what it's name indicates.

No. 23. **BEE-KEEPING IN JAMAICA.**

No. 24. **BEE-KEEPING IN THE WEST INDIES.** A practical book written for the English Department of Agriculture, by W. K. Morrison, valuable for all tropical countries.

No. 25. **HOW TO PRODUCE EXTRACTED HONEY.**

No. 26. **THE DZIERZON THEORY.**

No. 27. **DOVETAILED HIVE AND ITS USES.**

No. 28. **DIVISIBLE-BROOD-CHAMBER HIVE.**  
No. 29. **MOVING AND SHIPPING BEES.**  
No. 30. **THE BEE-KEEPER AND THE FRUIT GROWER.**

## Popular Works on Bee Culture.

The list of books below are for the most part by writers of well-known literary ability, and are very interesting indeed, and are greatly valued by bee-keepers and others for their literary merit, and the popular style in which bee-keeping is depicted and we are very glad to have the opportunity to offer them to bee-keepers and others. The description of each work will give a fair idea of the same, but a pamphlet giving an extended view of these and the practical books on bee culture listed in the preceding columns will be sent on application.

**THE HONEY-MAKERS.** By Miss Margaret W. Morley. This is the story of the life of the bee, told in very interesting style—how it lives, gathers honey, and all about it. While clothing the general subject with an air of poetry, it seems to be entirely within the limits of known facts while attempting to deal with them. We believe it will give all thoughtful bee-keepers a greater liking for their business to read it. Probably it has more to do with the curious traditions connected with bees than any other book of the kind. Price \$1.50 postpaid; by freight or express, 10 cents less.

**THE LIFE OF THE BEE.** By Maeterlinck. This is a masterpiece of fine writing by a modern Shakespeare. The words fly from the pen of this writer like sparks from a blacksmith's anvil, the result being a glorification of the honey-bee. Maeterlinck is considered by many to be the finest writer now living, and any thing from him is sure to be worth reading. He is, to a certain extent, familiar with bee-keeping, but the truth about bees does not interest him so much as the romance of the queen and the drone and the swarming instinct. The book itself is well bound and beautifully printed. Cloth bound, 42 pages. Ed. 1903, price \$1.40 postpaid; by freight or express, 10 cts. less.

**THE BEE PEOPLE.** A book on bees, especially for children, from the pen of Margaret W. Morley. Including its elegant illustrations, it is, in some respects, the prettiest bee-book in existence. It has 177 pages, very coarse print, the reading being ingeniously interwoven with the illustrations showing the parts of the bee. The story of bee-life is told in a fascinating manner, and is well calculated to get the casual reader, as well as children, interested in this useful insect. The cuts go just enough into detail to explain fully the lesson taught, without confusing the mind with other things. We think the book well worthy a place in every bee-keeper's home. Fittingly designed cover. Price \$1.50 postpaid; by freight or express, deduct 10 cents.

**THE SWARM.** By Maurice Maeterlinck, author of the Life of the Bee. This is a book of 113 pages, prettily bound in cloth. Price \$1.20 postpaid; by freight or express, 10 cents less.

**THE BEE-MASTER OF WARRILOW.** Tickner Edwards. Cloth bound, 64 pages; 57 cents postpaid; by freight or express, 7 cents less.

## BEE MODELS—THE ANATOMY OF THE BEE.

There are a good many bee-keepers who will admit they ought to know more about the anatomy of the bee; but owing to the difficulties surrounding the subject they have thus far been unable to acquaint themselves in the least with the marvelous structure of the honey-bee. For such persons there has been constructed a *pasteboard* bee, showing all the internals of a queen and also a drone in a manner that leaves little to be desired. With the aid of the key, any intelligent person may soon become well acquainted with the anatomy of the bee and the proper name of each organ. First there is a life-like representation of the queen and drone (separately). By lifting the outer covering the breathing apparatus and digestive system are unfolded; lifting again there will be found the reproductive system and poison-glands; and by again lifting, the nervous system is clearly outlined. Every thing is as clear as daylight, as each part and organ is numbered, and the key which we send gives the correct scientific name of the same. Our models of the queen measure 6½ inches, while those of the drone are 5½ inches. We can furnish the two with a key for 75 c. postpaid; or either one at 50 c. postpaid.

### Honey and Wax for Sale

**FOR SALE.**—To reduce stock I offer for sale as follows: 26 cases of stock No. 40, and 40 cases of stock No. 44 at \$10.80 per case of two 60-lb. (new) cans. This is a raspberry-basswood blend, and is the cream of two apiaries; being extracted from select all-sealed upper stories. A third of a century's experience in the production of fine extracted honey. Ask for my little circular "A Word about Extracted Honey;" this will explain why it pays to buy this delicious stock.

E. D. TOWNSEND, Remus, Mich.

**LISTEN!**—The two cases of honey are received, and I am greatly pleased with it. I don't think I ever saw finer honey in my life.

E. W. PEIRCE, Zanesville, Ohio.

You will be just as well pleased with your honey as Mr. Peirce if you send your order to JAY NORTH, of North Adams, Mich. One 60-lb. can, 8½ cts.; two 60-lb. cans, 8½ cts. For larger orders write for prices. Sample free.

**FOR SALE.**—My new crop of white-clover extracted honey. Honey has been left in full charge of the bees for three weeks after harvest, and is rich, waxy, and of fine flavor, and is as good as a specialist can produce. Price is 8c. per lb. by the case of 120 lbs. or for the entire crop. Cash to accompany order.

LEONARD S. GRIGGS, 711 Avon St., Flint, Mich.

**FOR SALE.**—Comb honey, amber, buckwheat, and No. 2 white, at \$2.75 per case of 24 sections; in 25-case lots, 5 per cent off; light amber extracted (three-fourths clover), in 60-lb. cans, two to case, at 8 cts.

QUIRIN-THE-QUEEN-BREEDER, Bellevue, Ohio.

W. L. COGGSHALL, Groton, N. Y.

**FOR SALE.**—Choice extracted honey for table use, gathered from clover and basswood—thick, well ripened, delicious flavor. Price 9 cts. per lb. in 60-lb. cans, two to case. Sample, 10 cts.

J. P. MOORE, Queen-breeder, Morgan, Ky.

**FOR SALE.**—I have some extracted honey, well-ripened, fine, clover and basswood, in new five-gallon round cans, at \$5.50 a can; sample free; delivered f. o. b. cars here; ought to suit anybody.

MATHILDE CANDLER, Cassville, Wis.

**FOR SALE.**—Three thousand pounds of fine buckwheat honey in new cans. Send for sample and prices.

EARL RULISON, Rt. 1, Amsterdam, N. Y.

**FOR SALE.**—Clover, amber, and buckwheat extracted honey. Table quality. Write for prices, stating your needs.

C. J. BALDRIDGE, Homestead Farm, Kendaia, N. Y.

**FOR SALE.**—Honey, clover, or buckwheat, comb or extracted. Write for price. Sample of clover extracted free. State quantity and quality desired.

C. B. HOWARD, Romulus, N. Y.

**FOR SALE.**—Choice extracted honey, mostly clover and raspberry mixed; also light buckwheat. Price on application. Sample 10 cents.

JAMES MCNEILL, Hudson, N. Y.

**FOR SALE.**—8 tons of raspberry and basswood extracted honey, thick and very fine flavor, in new 60-lb. cans, 2 in case, at 7½ cts., f. o. b. cars here.

J. N. HARRIS, Mancelona, Mich.

**FOR SALE.**—2½ tons clover, also light amber; new crop, ripened on hives, new 60-lb. tins; 8½ to 10, f. o. b. Sample 10 cts.

E. L. PRATT, Queen-breeder, Swarthmore, Pa.

**FOR SALE.**—Well-ripened clover and buckwheat honey, in small or large packages; ask for sample and what you want.

D. H. COGGSHALL, Groton, N. Y.

**FOR SALE.**—Fine extracted honey, 5-lb. cans up to barrels.

JULIUS GENTZ, Shawano, Wis.

**FOR SALE.**—Fancy and No. 1 white-clover comb honey.

ANTON G. ANDERSON, Holden, Mo.

## Honey and Wax Wanted

**WANTED.**—Comb, extracted honey, and beeswax. State price, kind, and quantity.

R. A. BURNETT, 199 South Water Street, Chicago, Ill.

**WANTED.**—25 tons of fancy comb honey. Write, stating particulars, to C. M. CHURCH, New Kensington, Pa.

## Real Estate for Bee-keepers

**PECOS VALLEY** of New Mexico lands are coining \$50 to \$65 net per acre per year from alfalfa. Forty-five thousand acres of alfalfa in bloom five times a year, surrounding Artesia, means *honey for the bee-keeper*. Live in an ideal fruit country, where the largest artesian wells in the world constantly pour out their wealth. Artesia, the future Rose City, already has the famous "Mile of Roses." Homeseekers' excursions the first and third Tuesdays of each month. Agents wanted, to accompany parties. Write to-day to R. M. LOVE, General Agent, Artesia, N. M.

**FOR SALE.**—Delaware farm, public road; good buildings, good water; fruit, wood; rural delivery; school, churches, stores, mills, railroad depot, canneries, blacksmith shops, all convenient; an ideal place for bees, poultry, fruit, and trucking.

L. A. LUDWIG, Maryland, Md.

**FOR SALE.**—Small homestead, first-class buildings, fully equipped apiary, in one of the most desirable locations to be found; will sell for less than the improvements can be replaced for. This was the home and the apiary of the late B. Taylor at Preston. Write for particulars. ALF. A. ZIEMER, Waltham, Minn.

**FOR SALE.**—California foothill ranch, San Diego Co., 160 acres, twenty-five in cultivation; house and barn; three acres orchard; 100 hives of bees; one span of horses; bee material and farming tools, \$1800.

AUSTIN E. WHITE, Fallbrook, California.

**FOR SALE.**—Excellent location for apiary in the white-clover belt of Northern Wisconsin. Basswood, goldenrod, dandelion, and willow, abundant; 8½ acres, dwelling, telephone, R. F. D. Clear title. Price \$800, half cash, balance one and two years time on secured notes.

ARNST ARNESON, Rice Lake, Barron Co., Wis.

**FOR SALE.**—Eleven acres, new house, 180 stands of bees, household goods, 2 horses, wagon, top buggy, pigs, chickens, tools, vinegar; including everything on the place; cheap, \$1800. Write for particulars.

L. W. BLIZZARD, Sunny Side, Cal.

## For Sale

**FOR SALE.**—A full line of bee-keepers' supplies; also Italian bees and honey a specialty. Mellifluous (sweet clover) seed for sale at 8 cts. per lb. Write for catalog and particulars.

W. P. SMITH, Penn. Miss.

**FOR SALE.**—About 1300 or 1400 cases, two five-gallon cans each, practically free from nail-holes, and were new tins when originally shipped to us. Make us an offer.

CLEVELAND HEALTH FOOD CO., Cleveland, O.

**FOR SALE.**—Beautiful long-haired Persian and Angora cats and kittens; solid whites and various colors; none better. Send stamp for written reply.

KENSINGTON CATTERY, Marion, Ohio.

**FOR SALE.**—Shipping-cases, the no-drip kind; overstocked; get our special prices.

A. G. WOODMAN CO., Grand Rapids, Mich.

**FOR SALE.**—Sweet-clover seed, 15 cts. per pound, postage extra. Root's supplies. ANTON G. ANDERSON, Holden, Mo.

## Poultry Offers

A. I. Root's Bee-goods, Poultry-supplies, Seeds, etc.

STAPLER'S, 412-414 Ferry St., Pittsburgh, Pa.

**FOR SALE.**—Indian Runner ducks, great layers, cheaper than ever, \$2.00 each; \$3.50 per pair, \$5.00 per trio. Circular free.

KENT JENNINGS, Mt. Gilead, Ohio.

## Wants and Exchanges

WANTED.—Refuse from the wax-extractor, or slumgum. State quantity and price. OREL L. HERSHISER, 301 Huntington Ave., Buffalo, N. Y.

WANTED.—Bees. Spot cash prices. All letters answered F. B. CAVANAGH, Springport, Mich.

WANTED.—Bees on shares or lease for season of 1909; Pacific States preferred. C. A. WURTH, 640 Leverette St., Fayetteville, Arkansas.

## Bees and Queens

FOR SALE.—Moore's strain and golden Italian queens, untested, \$1.00; six, \$4.00; twelve, \$7.00. Carniolan, Banat, and Caucasian queens, select, \$1.00; six, \$5.00. Tested, any kind, \$1.25; six, \$6.00. Choice breeding queens, \$3.00 each. Circular free. W. H. RAILS, Orange, Cal.

I will sell or lease to a good bee-keeper 1000 hives of bees. These bees are in good locations in the Mesilla Valley, New Mexico—finest climate in the world; no cold winters; never been a failure in the honey crop in this valley; bees averaged 150 lbs. of extracted honey to the hive in 1908.

MRS. L. C. HARRIS, Mesilla Park, New Mexico.

FOR SALE.—Italian bees and queens now ready. Untested, \$1.00; tested, \$1.50. Bee-keepers' supplies, Root's goods. Send for prices. Eggs from Silver-laced Wyandotte poultry. N. V. LONG, Biscoe, N. C.

FOR SALE.—100 colonies of bees, finely equipped for comb honey in the famous clover and buckwheat districts of Seneca Co., N. Y. Good chance for out-apiaries.

B. F. HOWARD, Union Center, N. Y.

FOR SALE.—Italian bees. Write for bargains in bee-supplies. Barred P. Rock, White Wyandotte cockerels, each, \$1.00. H. S. DUBY, St. Anne, Illinois.

## Help Wanted

WANTED.—Capable man 30 to 40 years of age, married, to take charge of small farm in Ohio. State experience, salary wanted, date could begin, and give names of references. Address JOHN SMITH, Gleanings in Bee Culture, Medina, O.

## Situations Wanted

WANTED.—Situation. My bees failed me this season. I wish employment for winter; might arrange to work for longer time. Am 34 years of age, single, strong, and well, free from bad habits; a hustler; am well versed in bees, poultry, and incubators; also care of stock. Can furnish most satisfactory reference. FRED G. MASON, Fabius, N. Y.

WANTED.—Situation by practical bee-keeper, or bees on shares in Porto Rico or Jamaica. B. F. HOWARD, Union Center, N. Y.

## Bee-keepers' Directory

I no longer club a queen with GLEANINGS.

W. T. CRAWFORD, Hineson, La.

Bee-keepers' Supply Co., Lincoln, Neb. We buy car lots of Root's goods. Save freight. Write.

No more queens for sale this fall.

A. W. YATES, 3 Chapman St., Hartford, Ct.

ITALIANS, CARNIOLANS. No disease. Two-comb nucleus with queen, \$3.00. A. L. AMOS, Comstock, Nebraska.

GOLDEN yellow Italian queens—my specialty. Price list free. E. E. LAWRENCE, Doniphan, Mo.

ROOT'S BEE SUPPLIES. Send for catalog. D. COOLEY, Kendall, Mich.

Mott's long-tongues by return mail, also goldens—hardy, yet gentle, but little or no smoke. E. E. MOTT, Glenwood, Mich.

Well-bred bees and queens. Hives and supplies. J. H. M. COOK, 70 Corlandt St., New York City.

For bee-smoker and honey-knife circular send card to T. F. BINGHAM, Farwell, Mich.

ITALIAN BEES, queens, honey, and Root's bee-keepers' supplies. ALISO APIARY, El Toro, Cal.

Golden-all-over and red-clover Italian queens; circular ready. W. A. SHUFF, 4426 Osage Ave., Philadelphia, Pa.

Root's bee-supplies at factory prices, *Black Diamond Brand Honey*, and *bee-literature*. Catalog and circulars free. GEO. S. GRAFFAM & BRO., Bangor, Maine.

QUEENS.—Improved red-clover Italians, bred for business, June 1 to Nov. 15, untested queens, 60 cts.; select, 75 cts.; tested, \$1.00 each. Safe arrival and satisfaction guaranteed. H. C. CLEMONS, Boyd, Ky.

Improved Italian queens now ready. Nuclei and colonies May 1 to 10. Over twenty years a breeder; 500 colonies to draw on. Free circulars and testimonials. For prices see large advertisement in this issue.

QUIRIN-THE-QUEEN-BREEDER, Bellevue, O.

ITALIAN BEES AND QUEENS. I breed three-banded stock only, and use the finest breeding stock to be had. For prices, see display advertising columns in this issue. Send for price list. Twenty-five years' experience.

F. J. WARDELL, Uhrichsville, O.

TENNESSEE QUEENS.—Best that experience can produce. Untested three-band and goldens, \$1.00 each; 6 for \$5.00; 12 for \$9.00. Bees Caucasian, \$1.25 each. Write for circular; order goldens from Ben G. Davis; others from John M. Davis, Spring Hill, Tenn.

Breeding queens of pure Caucasian and Carniolan races—price \$3.00. Order from A. E. Titoff, Expert in Apiculture, with Russian Department of Agriculture, Kieff, Russia. Remit with orders. Correspondence in English.

Honey Market reports continued from page 1202.

COLUMBUS.—The demand for honey shows some improvement, and we believe that a steady demand will be in evidence the rest of the season. The market to-day on strictly fancy white, 15; No. 1 white, 13½ to 14; No. 2 white, 12. Amber honey is very draggy, the top price being about 10 cts. per lb. Oct. 20. EVANS & TURNER, Columbus, O.

NEW YORK.—The demand for honey is good, particularly on fancy white-clover and buckwheat comb honey. Ship now to obtain best prices. The following are the prices we are getting: Fancy white clover, 15 to 16; No. 1 ditto, 13 to 14; No. 2 ditto, 11 to 12; white extracted, 7 to 7½; light amber, 6½ to 7; buckwheat, 6½ to 7; fancy buckwheat comb honey, 12 to 12½; No. 1 ditto, 11 to 12; No. 2 ditto, 10 to 11.

CHAS. ISRAEL & BRO., 486 Canal St., New York.

Oct. 21.

NEW YORK.—The demand for comb honey is fair, but not up to that of former years. Receipts are sufficient to meet demands. There is no overstock, however, and prices are holding firm. We quote: Fancy white, 15; No. 1, 13 to 14; No. 2, 12; dark and amber, 10 to 11, according to quality and style of package. Extracted is in fairly good demand, but supplies are large. We quote: California white sage, 8½ to 9; light amber, 8; white clover, 8 to 8½; amber and dark, 6½ to 7; Southern, in barrels and half-barrels, 60 to 75 cents a gallon, according to quality. Beeswax is dull and declining. We quote nominally 28 to 29.

HILDRETH & SEGELKEN, 265 Greenwich St., New York.

Oct. 22.

SAN FRANCISCO.—Prices quoted by the packers here are steady to firm as formerly given. Small lots are still coming forward from the growers, and the demand is fair, with considerable of the better grades moving east. We quote: Water-white comb, 16 to 17; white, 15; water-white extracted, 8 to 8½; light amber, 7 to 7½; dark amber, 5½ to 5¾; candied, 5¾ to 5¾.—*Pacific Rural Press*, Oct. 17.

## SPECIAL NOTICES

By Our Business Manager

### HALF-POUND TUMBLERS.

We have a new supply of half-pound tumblers in our branch offices at Chicago, New York, and Philadelphia, the same size as No. 12 in our honey-package catalog. These came from another factory, whose number for them is 50. They are packed 4 dozen to the case and 30 dozen to the barrel. We make a special price for a short time as follows:

Half-pound tumblers, 4 doz. to case, 90 cts. per case.

Half-pound tumblers, 30 doz. to barrel, \$5.50 per barrel.

Six cases or more at 85 cts.; 25 cases at 80 cts.; 5 barrels or more at \$5.25 per barrel. Barrels of 32 dozen may, in some cases, be substituted at 25 cts. each more than above prices.

These prices are not subject to early-order discount, but are special, good for only a short time.

### A BARGAIN IN SQUARE JARS.

In order to reduce a surplus stock we are prepared to offer a special bargain in square jars of small size. These are put up 100 to the crate, and, including corks, we offer them as follows: 5-oz. square Powder jars, including corks, \$2.00 per 100; 1/2-lb. square Powder jars, including corks, \$2.25 per 100. In 500 lots you may deduct 5 per cent, and in 1000 lots 10 per cent from above prices. To make a really neat and attractive finish, tinfoil caps should be added. We will include these at 25 cents per 100 extra, either size. This is a much handsomer package than a tumbler or jelly-glass, and at these prices it costs little if any more. Our stock offered at this price is limited, and the price holds only while the stock lasts. Shipments can be made only while the stock lasts. Shipments can be made only from Medina, at which point only are these jars in stock.

COLD-FRAME SASH.

As cold weather approaches, truck-gardeners are making plans for protection to the plants. We are prepared to furnish not only the regular cold-frame sash, 3 ft. 4 in. by 6 ft., but we also make special sash to order. The regular sash are usually shipped knocked down. Price 90 cts. each; 5, \$4.75; \$8.00 for 10. If put up, 10 cts. each extra, without paints; add 10 cts. for each coat of paint and \$1.00 for glazing, making the sash complete, with glass and two coats of paint, \$2.10 each. Our sash are made of cypress, 1 3/4 inch thick, and as regularly furnished they are grooved for glass to be butted together. If preferred we also rabbet the bars so glass can be lapped and set in putty. Regular sash take four rows of 8x10 glass. We make on order other styles and sizes. Enquiries and orders solicited.

## Special Notices by A. I. Root

### BASSWOOD-TREES FOR FALL PLANTING.

We have for years sent out little trees in both fall and spring; but of late the evidence seems to be considerably in favor of spring planting. We are still prepared to furnish trees, by mail or express, as we have in former years, but I should be glad to know how many have, in former years, succeeded in planting basswoods, especially in the fall. A brief report on a postal will be sufficient. If you wish to risk fall planting, the prices will be as follows: Trees one foot or under, 10 trees, 30 cts.; 100 trees, \$2.00. The above by mail, 10 trees, 35 cts.; 100, \$2.25. Larger trees, one foot to five in height, by express, 10 trees, 75 cts.; 100, \$5.00. We can ship them any time before the ground freezes. We would not advise fall planting during a very dry spell of weather. Our trees have passed Government inspection.

### BATTERY-TESTERS TO ASCERTAIN THE STRENGTH OF DRY BATTERIES.

Everybody who has any use for dry batteries should certainly have one of these testers. One battery may do twice as much work as another one, or more; and it is very important to be able to pick out the weak ones and use the strong ones as long as they will last. With my automobile I carry with me only one or two new batteries. When the current becomes weak I can pick out the poorest one in a few minutes and replace it with a brand-new one. Without this battery-tester you would have to carry a full set and then throw away your old sets, when some of them might be almost as good as new. We can mail them anywhere for \$1.00. Full directions go with each instrument.

### POULTRY-BOOKS AND POULTRY-JOURNALS.

Every little while somebody is asking to be advised in regard to the best book or journal on poultry. This is a hard matter to decide. It depends a good deal on the branch of business you are going to take up; and it depends on whether you make it a side issue to keep a few chickens in your back yard or whether you wish to give your whole time and attention to it. On page 965, August 1, I gave a list of some of the very best books that we have in stock, that are offered to the readers of GLEANINGS at just half price. I do not know of any better books than these; and as none of these books are sold out but one, I advise you to turn back to that number and read the list over again. These books are all nicely gotten up, and offered at half the regular publishers' price to any one who sends a dollar for GLEANINGS or to any one who has paid up for GLEANINGS for one year or more ahead.

## Convention Notices.

The annual meeting of the Middlesex Bee-keepers' Association will be held in the City Hall, London, Ontario, on Saturday Nov. 7, commencing at 10 o'clock. A good program is arranged, and all will be welcome. E. T. BAINARD, Sec.

### BEE-KEEPERS' CONVENTION AT YORK, PA.

The Pennsylvania State Bee-keepers' Association will hold its annual convention at York, in the Court-house, on Thursday and Friday, November 12 and 13. The program is not completed; but as it now stands it may be announced to begin at 1:30 P. M., Thursday, with an evening session; and two sessions Friday forenoon and afternoon. Dr. E. F. Phillips will speak on one or both of the following subjects: A general discussion of apiculture in the United States, and the treatment of bee diseases. Professor Surface will speak on hay and honey-plants. Mr. E. R. Root will be present, and will probably speak on some phase of bee-keeping. A. F. SATTERTHWAIT, Sec.

### MEETING OF MASSACHUSETTS BEE-KEEPERS.

The Massachusetts Society of Bee-keepers had a delightful field meeting July 18, at the camp of Mr. F. H. Farmer, in Littleton, Mass. The weather was delightful, the invited guests from Worcester were in their most genial mood, and the camp was an ideal place for such a meeting.

Among the speakers for the day were Mr. Hixon, secretary of the Worcester Society; Mr. Britton, of Canton; Mr. Cooper, of Stoughton; Mr. Byard, of Marlboro; Mr. Barrett, of Hyde Park; Mr. Blake, of Ashby, Mass., and Mr. Taylor, of Southboro.

All sorts of subjects pertaining to honey and the care of bees were discussed, and a practical lesson given in the transferring of a colony from a box hive to a frame hive, by Mr. Farmer and Mr. Lamb.

Our basket lunch was supplemented with ice cream and coffee through the kindness of our host.

The slight shower in the afternoon did not dampen the ardor of the society in the prosecution of its work, and the appointment of a legislative committee to work with the Worcester committee for legislative aid against foul brood testified to the earnestness of the society. There were about 75 present, and some new members were taken into the society. Mr. Robbins had a fine specimen of honey in section boxes—a rack all nicely filled. Mr. E. C. Britton, of Canton, Mass., a member of the society, had a very fine specimen of apple-blossom honey in one of the Danzenbaker frames. He informed us he had seven more at home, equally good. I was fortunate enough to secure one of these frames, so I can vouch for the quality of the same. I never saw nicer. All this was from the Adel queen. If I am not mistaken, these queens can now be obtained of Mr. A. D. Tuttle, 114 Portland Street, Haverhill, Mass.

Our next meeting will be November 7, 2:30 P. M., Ford building, corner Ashburton Place and Bowdoin Street. The speaker will be Prof. Paige, Amherst College, Mass. The subject of foul brood and how to treat it will be given. Other speakers are expected on other subjects. X. A. REED, Pres.

Belmont, Mass., Oct. 14.

KEEPERS' SUPPLIES, AND BOOKSELLERS.

### READ WHAT EXPERTS SAY OF IT

The Christmas mail brought me what is probably as useful and beautiful a Christmas present as I ever received—a morocco-bound copy of the new edition of the A B C and X Y Z of Bee Culture. Bee books and journals have come to my desk of which it seemed as though the least said the better. Not so with this book. On the contrary, it seems as though words were lacking to do it justice. There are many other bee-books, each filling its niche, but, in all the world, there is nothing so comprehensive as the A B C and X Y Z of Bee Culture. There is no point in the wide domain of apiculture that is not touched upon in this volume, and the information is the very latest and most authentic, well written and well illustrated. The amateur and the expert are both served equally well.—W. Z. HUTCHINSON, editor and proprietor of the *Bee-Keepers' Review*, and author of *Advanced Bee Culture*.

No bee-keeper's library can be at all complete without a copy of this magnificent apiarian work. It has reached a sale of over 100,000 copies already, being the most largely sold book on bees in the world. Better send to us for a copy to read during the long winter evenings.—*American Bee Journal*.

This work of 536 pages is, as its name implies, a complete cyclopædia of everything pertaining to bees and bee-keeping. It was originally compiled by A. I. Root, who in the 1877 preface, after stating his indebtedness to Langstroth, Quinby, and others, says that "A great part of this A B C book is really the work of the people, and the task that devolves on me is to collect, condense, verify, and utilize what has been scattered through thousands of letters for years past." Since the first copy of this work appeared, now thirty-one years ago, it has undergone many revisions, and has had many additions, both of letterpress and illustrations, while the rapid advancement in bee culture has made it necessary in many cases to remove whole articles and rewrite them entirely. The revision has been ably carried out by E. R. Root, the present editor of *GLEANINGS*, who has had the assistance of a number of well-known and able men. In the preface the names of the writers of the different articles are given. For instance, we find Dr. C. C. Miller writes on honey-comb and out-apiaries; Dr. E. F. Phillips on the eye, parthenogenesis, and scent of bees; E. R. and H. H. Root on wax and wintering, both of these having carried out a number of experiments on these subjects. There are also articles by W. K. Morrison and Mrs. Comstock. It seems almost superfluous to say any thing about a book of which already 100,000 copies have been sold; the simple fact speaks for itself that it fills a want, and is an attestation of its worth. Among the articles that have been revised we find the new methods of queen-rearing described, so that the practical bee-keeper will have the latest and best ideas on the subject before him for reference. The new methods of wax-production are treated in an exhaustive manner; and as this subject is of more importance than formerly, greater space has been devoted to it. We have nothing but good words for this work, and recommend our readers to get a copy of the 1908 edition. The work is profusely illustrated and beautifully printed, and is a credit to the publishers.—By T. W. COWAN, Esq., editor of the *British Bee Journal*. Mr. Cowan is the author of two first-class books on bees and bee-keeping, "The Bee-keeper's Guide" and "The Honey-bee."

# Don't Buy a Stove or Range Until You First See How Much You Save By Getting

## "A Kalamazoo Direct to You"

TRADE MARK REGISTERED

**YOU** want to make every cent you spend this year, **count for quality and economy.**

If you need a stove or range, don't buy until you get our **factory prices.** I promise you that I will save you \$5, \$6 or \$10 on our smallest stoves, and as high as \$18, \$20 and even \$30 on our largest. And I promise you that you cannot get **anywhere at any price, a better stove or range than the Kalamazoo.**

Just let me quote you prices. Take our catalogue and **compare the Kalamazoo quality and prices,** with the best line of stoves and ranges you can find sold at retail. That will tell the story. You can see for yourself. You want to save money and you want to get high quality. Why not investigate our plan, then? Why not let me show you the difference between manufacturers' prices and retail prices on stoves or ranges?

We sell to you, direct from the factory, at actual factory prices,

### On 360 Days Approval Test—We Pay the Freight

I promise, in black and white, to refund your money—every cent of it—if you do not find your purchase in every way exactly as represented.

Remember, every Kalamazoo is of the highest possible grade, made of the best materials and in the best manner. You deal directly with the manufacturers—a company that has a larger number of individual customers than any other stove company in existence. We have sold thousands of stoves and ranges to readers of this journal, and no doubt can refer you to near neighbors who have saved money by buying a Kalamazoo. Many customers write that they have saved enough on a single Kalamazoo to pay for a whole season's fuel. You can save enough to buy a new suit, a new dress, an article of furniture, or perhaps to pay your taxes. Is it not to your interest to get our prices?

### Send Postal for Catalogue No. 416

# A "Lincoln Farm Almanac" for 1909

|                                     |        |
|-------------------------------------|--------|
| Gleanings in Bee Culture, one year. | \$1.00 |
| Farm Journal, five years            | .75    |
| Lincoln Almanac                     |        |
| Total                               | \$1.75 |

**ALL OF THE ABOVE  
IF ORDERED OF GLEANINGS  
FOR ONLY**

**\$1.50**

THE FARM JOURNAL has printed this year a splendid Almanac for 1909, which will be, because of special features, one of the most interesting ever issued.

On the 12th of February, 1909, is the hundredth anniversary of the birth of Abraham Lincoln; all sections, parties, and colors will unite to honor his memory. There will be impressive ceremonies at the birthplace of Lincoln in Kentucky, where President Roosevelt is expected to speak.

The Lincoln material in our Almanac consists of new and old stories and anecdotes of Lincoln, his boyhood on the farm, later life, some of his best stories, his own account of his life, famous sayings, his wonderful Gettysburg speech, a brief account of his death, and other matter. This is illustrated with original drawings done especially for this work.

Besides this, the Almanac contains a calendar for 1909, with records of important events, calculations of sun and moon for northern and southern latitudes, etc.

Twenty-four pages are devoted to matters of interest to all farmers, including a new and complete spraying-table for fruits and vegetables, a planting-table, cubic, square, and long measures, table of weights, rules for curing dried beef, Smithfield hams, and other meats, household recipes, directions for canning and preserving, how to have good roads, a complete list of Farmers' Bulletins published at Washington, list of Experiment Stations for all States.

The Almanac is well printed, and is bound in a specially designed cover in two colors, with a striking profile view of Lincoln's head, a small copy of which is shown at the top of this article. THE ALMANAC CONTAINS NO ADVERTISING MATTER, except an announcement of the Biggle Farm Library on the inside of the last cover, and it must surely gratify and please.

We do not sell the Lincoln Farm Almanac on any terms. It is given, free, in connection with subscription offers only. It is sent in a special envelope, and safe delivery guaranteed.

**THE FARM JOURNAL.** The publishers of GLEANINGS have been acquainted with the *Farm Journal*, and we give it our unqualified endorsement. It is full of helpful money-making suggestions, and considering the low price at which we offer it (in connection with GLEANINGS it costs only 10 CENTS PER YEAR for a term of five years) no one can possibly regret the investment, especially when the new Lincoln Almanac is seen. Just think! Less than 1c per month for this invaluable farm paper. Send all orders to

## Honey Markets.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent), cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

### EASTERN GRADING-RULES FOR COMB HONEY.

**FANCY.**—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

**A No. 1.**—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

**No. 1.**—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

**No. 2.**—Three-fourths of the total surface must be filled and sealed.

**No. 3.**—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

### NEW COMB-HONEY GRADING-RULES ADOPTED BY THE COLORADO STATE BEE-KEEPERS' ASSOCIATION.

**No. 1 WHITE.**—Sections to be well filled and evenly capped except the outside row, next to the wood; honey white or slightly amber, comb and cappings white, and not projecting beyond the wood; wood to be well cleaned; cases of separated honey to average 21 pounds net per case of 24 sections, no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

**No. 1 LIGHT AMBER.**—Sections to be well filled and evenly capped, except the outside row, next to the wood; honey white or light amber; comb and cappings from white to off color, but not dark; comb not projecting beyond the wood; wood to be well cleaned.

Cases of separated honey to average 21 pounds net per case of 24 sections; no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

**No. 2.**—This includes all white honey, and amber honey not included in the above grades; sections to be fairly well filled and capped, no more than 25 uncapped cells, exclusive of outside row, permitted in this grade; wood to be well cleaned, no section in this grade to weigh less than 12 ounces.

Cases of separated honey to average not less than 19 pounds net.

Cases of half-separated honey to average not less than 20 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 21 pounds net per case of 24 sections.

**INDIANAPOLIS.**—While prices are not high, the demand for honey has never been better—a fact that can be attributed to the quality of goods now on our market. This is a white-clover district, and our market is almost free from honey from other sources. Producers are offering fancy white comb at 12½; No. 1 white, 12; white clover, extracted, in five-gallon cans, 7. Some amber honey is being offered, but the demand is not sufficient to establish a price. Beeswax is steady at 28 cts. cash, or 30 cts in exchange for merchandise.

Nov. 3. **WALTER S. POWDER, Indianapolis.**

**BOSTON.**—White fancy comb honey, 15 to 16; No 1 ditto, 13 to 14; extracted white, 9 to 10; extracted amber, 7 to 8; amber in barrels, 6 to 7. Beeswax, 30. **BLAKE-LEE CO.,**  
Nov. 6. 4 Chatham Row, Boston, Mass.

### BEE-KEEPING FOR SEDENTARY FOLK.

This refers to a new booklet just off our own press, written by a Presbyterian divine, the Rev. T. Chalmers Potter, of Glasgow, Del. It is dedicated to professional people—the clergyman, the lawyer, the doctor, the teacher, and all others whose duties in life render it necessary for them to be mostly indoors, but who feel the need of some suitable recreation in the open air which will be at once conducive to health and remunerative to the worker. The article originally appeared in the *Interior*, one of the leading organs of the Presbyterian Church in America. It presents the case for bee-keeping as a hobby in a very pleasing manner, showing what can be done to make it both pleasant and profitable. Of course, this will not interest any who are already well established in bee-keeping; but to the beginners, or those who have no bees, we believe it will prove thrice interesting. If you have a friend you would like to see take up bee-keeping, please write for a free copy. Beginners are particularly requested to send for a copy at once before the supply is exhausted. Those who have never had bees will find it very useful in blazing the way for a successful career in bee culture. It is free.

### FURS FOR ALL.

One of the most interesting advertisers in these pages to the average rural dweller is the National Fur and Tanning Company. They make all kinds of garments, robes, etc., from skins and pelts furnished by their customers. This makes it possible for many to possess nice warm fur clothing who would not otherwise have it. It is easy for most country residents to obtain skins and pelts; but usually they have had to be content with what dealers saw fit to pay for them. They can obtain much better results by sending them to the above firm to be made into nice garments for their own use. This looks better to us than to sell the skins at low prices. If you go to buy furs you will find they cost lots of money; in fact, the prices are prohibitive in many cases. Write to the National Fur and Tanning Company.

### SYSTEM.

It is not often that we get a 9059 word-book free. But this is just what *System* in another column offers us, and we believe the offer is *bona fide*. It is no useless book, either, nor a mere catalog. It is valuable to many, especially those wanting a business career, and is crammed with interesting facts. It is well worth sending for. Write to System, Dept. 9—12, 151, 153 Wabash Ave., Chicago, Ill.

### AERMOTORS.

It is hardly necessary for us to introduce to our readers the celebrated Aermotor Co., of Chicago. Their "aermotors," or windmills, are in use, not only all over the United States, but all over the earth. In some parts of the world windmills have come to be known as *aermotors*, simply because the latter were very numerous, and so much superior to all rivals, that the name had to be changed to suit the case. Wind is a very

cheap motive power; and where one has an aermotor it can be made to do a great deal of hard work now done by human exertion. The aermotor is not only effective, but, in addition, costs but little to erect. Send for a catalog. At present they are making a special drive on a gasoline engine for pumping purposes. The price is very low.

Every number is worth more than the  
price asked, costs more—there-  
fore we can not distribute free.

## Fashion Book Free!

I want to send you my handsome new book showing over 400 of the latest styles with illustrated lessons on cutting and dressmaking. I will agree to sell you all the patterns you want for 5 cents each. They are the same patterns you have always paid 10c and 15c for at the stores, made by the same people, and correct in every detail.

### HOW I DO IT.

I publish **The Home Instructor**, an illustrated woman's magazine and I want your name on my subscription list. **The Home Instructor** is bright, entertaining, clean and instructive—just the sort of a paper you should have in your home. It has departments for every feature of home life, and prints the choicest fiction every month.

Every issue has several pages devoted to the latest fashions, fully illustrated.

### My Special Offer.

Send me 25 cents and I will send you **The Home Instructor** for two years and will send my big fashion book to you free. I will also agree to sell you any pattern you want thereafter for 5 cts. I can sell them for 5 cents because I buy them by the thousand and don't make any profit. I don't want the profit, I want your subscription to **The Home Instructor**. You will save many times the cost of my offer in a year. Write to-day A. OTIS ARNOLD, Dept B Quincy, Ill

### BULLDOG SUSPENDERS FOR CHRISTMAS.

Most American men are well acquainted with the merits of the famous Bulldog suspenders. For those who are on the lookout for Christmas presents for their men friends, we believe the advertisement of Hewes & Potter, who make these suspenders, will prove extremely interesting just at this time. There are many readers of this journal who will take their offer of a "Bulldog" comb and case for a dime, accompanied by a copy of "Style; or, How to Dress Correctly." Their address is Hewes & Potter, Dept. 3298, 87 Lincoln St., Boston.

### CHRISTMAS BOX OF FRUIT.

One of the best possible Christmas presents is a box of California dried and canned fruits as put up by our advertisers, the California Fruit Products Co. They arrange these boxes in various combinations to suit the purse. This will make an excellent present, rather out of the ordinary, and yet very useful in almost any household. It should be noted that the freight is prepaid in all cases, so there is no trouble to be anticipated on that score. Many of our readers are so situated that they have some difficulty in getting such an assortment of fruit at a reasonable price in their own neighborhood. It will be easier for many simply to order from California direct.

### IRRIGATED LAND ON EASY TERMS.

Any one on the outlook for a place to make a home can not do better than carefully study the advertisement of the Burlington Railway, in another column. There are no more desirable lands on earth than these irrigated tracts in the Northwest. Crops are absolutely certain. Not only so, but every thing raised is of fine quality, and the crops are large. Furthermore, the prices obtained are excellent on account of the large number of miners, who earn good pay. The climate is salubrious and pleasant. A farmer can hardly expect ever to find any thing better in his line. These western places have very good school facilities—usually better than eastern places with a larger population. Churches are numerous wherever there is a settlement of people, and all up-to-date improvements are adopted. If you want land we earnestly advise a trip to look over the situation for yourself. Mr. Clem Deaver is a well-posted land man employed by the Burlington to see that settlers get the right place, where they will succeed beyond a doubt.

### OUR CHRISTMAS ISSUE.

As is our usual practice now, we will issue a special Christmas issue of GLEANINGS. Of course, our whole staff of contributors will be represented on its pages, and all possible care will be used in selecting matter suitable for the bee-keeping fraternity. We expect to make our Christmas issue our best for the whole year, and for this purpose we shall use quite freely the best illustrations we can secure. Of course, our regular readers know we charge no more for our Christmas number than for any other. We intend to print a far larger edition to allow for a much greater demand than ordinary and have enough to go around. The cost is necessarily far greater than for an ordinary issue, and we hope our readers will appreciate our earnest efforts to provide an extra-large intellectual bill of fare. They can, if they choose, do much to help us make it a financial success by showing the Christmas number to any and all bee-keepers who do not now subscribe to GLEANINGS. They can do a great service in this way; and any thing done for us in this manner will be highly esteemed as a favor. We believe there are a large number of bee-keepers not now subscribers to GLEANINGS who ought to be. In fact, many bee-keepers are losing money and pleasure by not sending in their subscription. We should like to get in touch with these backward bee-keepers; and this extra-fine number will give us the opportunity to appeal with force to them. Should you not care to lend your own copy of the Christmas number we will gladly send a sample copy wherever requested. Just send the name and address of your friend and we will attend to the rest. A little later you can ask him how he enjoys reading GLEANINGS, and if he would like to join you as a subscriber. Most of our old subscribers have done this in the past, and we greatly appreciate their efforts to help us build up a great bee-journal. Without their assistance we should certainly have failed. Having helped us once we think they will help us again. In any event, we take this opportunity to thank all who have rendered us assistance in the past, and also those who will help us now. We can not get a great circulation without the cordial co-operation of our present subscribers, hence this appeal to their good nature. With a larger field we can afford to make further improvements on this journal, and make every number equal to the Christmas issue. While we are animated by selfish motives in thus desiring to build up our circulation, it will be observed that, the larger our subscription-list is, the better journal we can turn out.

# GRUMIAUX

## THE MAGAZINE MAN

Let Me Teach You

### „THE MAGAZINE SUBSCRIPTION GAME .. A BUSINESS WITH A BIG FUTURE

#### How I Developed My Business from \$47 to \$400,000 a Year

The subscription agency-business is just beginning to develop, and every man and woman can learn it by my complete instructions, personally conducted by mail. You can in your leisure hours conduct a mail-order business that is dignified and earn **large profits** by the **Grumiaux System**.

Begin in a small way and watch it grow. The principles upon which I built my business become yours and the benefits of my 22 years' experience—you need not make the mistakes I did—the elements of success as I discovered them, my ideas, my schemes, all become yours through the **Grumiaux System**.

Year after year, the renewal business increases profits, and before you know it you have a substantial business of your own. Start by working a few hours evenings.

Full particulars by mentioning this magazine.

## IMPROVED DAN-ZE GUARANTEED 'ALL RIGHT'

GOLD MEDALS

St. Louis . . . 1904  
Jamestown . 1907

IS THE BEST,  
STRONGEST,  
COOLEST,  
CLEANEST,  
CHEAPEST,  
and LARGEST  
SMOKER SOLD  
FOR A DOLLAR.

With the side grate combines hot and cold blast deflecting part of the air back and over the fuel; COOLS as it expels the smoke, while part fans the side and bottom till all consumed. The Double-walled case, 3½ inches in diameter, has asbestos-lined sides and bottom, keeping all cool.

The projecting hinge-strap protects the smoke exit, and renders easy opening the one-piece cap.

THE VALVELESS metal-bound bellows combines simplicity, utility, and durability.

Five years increasing sales justify us in extending our GUARANTEE of PERSONAL RESPONSIBILITY for full satisfaction or REFUND of price on all our smokers sold by US OR OTHERS.

Price, \$1.00; two, \$1.60; mail 25c each extra.

DAN-ZE HIVES with metal Propolis-proof Guards.

ROOT'S Goods at Root's prices, early-order discounts. Write us for any thing you need. Free circulars for yourself and your friends.

If you want a home in this genial Sunny South Land, we will help you find it.

F. Danzenbaker, Norfolk, Va., or Medina, Ohio.

ARE OUR SPECIALTY.

Our double-walled hive is the best and lowest-priced one on the market. It will pay to investigate.

ESTABLISHED 1884

## ARE YOU NEEDING SUPPLIES?

Do not fail to write us for catalog and terms. November discounts, 5 per cent; December, 4 per cent, besides some low prices on odd stock not much called for, but may just suit your wants.

We keep in stock Root Co.'s perfect goods, "the standard." We equalize freight rates with St. Louis and Kansas City points on all shipments of 100 lbs. and over. Send us your inquiries early.

**JOHN NEBEL & SON SUPPLY COMPANY**  
MONTGOMERY COUNTY .. .. HIGH HILL, MO.

## "Practice Makes Perfect."

A little girl sat on her father's lap, looking into the mirror, and inquired if God made both her father and herself. Being assured that he did she remarked that he was doing better work than he ever did before.

It is simply the old adage over again, and it is true of *The A. I. Root Co.'s* Bee-keeping Supplies; and while perfection can never be attained they are as near perfection as improved machinery and years of practice can well make them. If you have never seen them, or if you have, and have not a catalog, send at once for my 40-page catalog, illustrated profusely, and giving prices of every thing used in the apiary. *It is free for the asking.* Special price list of shipping-cases, and all kinds of honey-packages—wood, tin, and glass. Send a list of what you will need at any time and let us tell you what they will cost you delivered at your station.

*Cash or goods for wax at all times.*

**George E. Hilton**  
Fremont, . . . Michigan

## MAKING A NOISE LIKE AN ORDER

*By the Bee Crank*

It is a pretty well-known fact that, if bees hear at all, they hear only loud noises that are produced at a very short distance. It is said that a heavy cannon-ading of a French battery, which went into action close to a group of bee-hives, during the Franco-Prussian war, did not in the least disturb the workers.

However, a noise like an order has such a peculiar penetrating quality that I am able to hear it for a long distance; in fact, at this season of the year, when things are normally quiet, I am concentrating my attention so closely that there is not the slightest danger of any thing that sounds like an order escaping me, and I am even allowing five per cent on all cash orders for supplies received this month—November.

This is not because my stock of goods is in any way less fresh or less

desirable than it always is. It is because it is a great advantage to me to have my patrons anticipate their wants instead of holding off till the last minute, as they are prone to do.

**HONEY.**—Write for my quotations. I carry a large stock of finest honey, and can help you piece out any deficiencies in your own stock. Many bee-keepers with small apiaries find that they can sell more

honey than they produce. It is a good plan to supply your home trade, and not educate the people to go elsewhere.

**BEE SWAX.**—I pay 28 cts. cash or 30 cts. in trade, delivered here. Send what you have, by freight or express, according to size of package.

Root goods at Root prices. A full stock of standard goods on hand at all times, and special discounts for November. Catalog free.

**Walter S. Pouder,**  
513-515 Massachusetts Avenue, Indianapolis, Ind.

## STRAY STRAWS

DR. C. C. MILLER

HERR SCHROEDER and his wife, of Trieste, Austria, made a flying visit to Marengo, leaving a streak of sunshine behind them.

STUDENTS of French who are bee-keepers would do well to get Dadant's Langstroth in French, "L'Abeille et la Ruche," as a reader. It's fine.

AN AGRICULTURAL JOURNAL says: "Spring is the best time in the year to move bees." It may be; but if a bee settles on your neck, or any other portion of your anatomy, in the fall, don't wait until the spring to remove it.—*Norristown Herald*.

AS POSTSCRIPT to the last item on page 1304, let me add that you may sometimes if not often find a case where the bees stop rearing brood, although the queen has not yet stopped laying. You will find eggs and sealed brood, but no unsealed brood. [We accept the amendment.—Ed.]

QUINBY said that a colony which had stored in supers might be expected to have plenty of stores for winter. That was true when he said it, for it was before the days of extracted honey. This year I think each of my colonies that stored in sections is well supplied for winter; but a few colonies that had stored in drawn combs were not more than half supplied.

ALSIKE is getting to be quite an item here. On the first crop I saw scarcely a bee. Was there a lack of nectar in it, or was it only because there was such an enormous amount of that and white clover? Bees were plentiful on the second crop of alsike, and so they were on red clover. [In our locality the first crop gave a large amount of nectar. We should conclude that weather conditions about Marengo were not favorable, or alsike would have yielded on its first crop as it did with us.—Ed.]

SUPPOSE one strain of queens lives twice as long as another; don't you believe one set of workers would live longer than the other? You can not easily keep track of the age of workers; but you can of queens. [We do not know whether we believe that a long-lived queen means long-lived workers; but this is true: A queen vigorous enough to live five years may transmit that same vigor or longevity to her workers; but the life of the worker is dependent on its wings to resist wear and tear; and it is dependent somewhat on the kind of flora it has to work on. A queen might have great power of egg-laying year after year, but breed bees with wings that would not stand very much strain or wear and tear in a growth of heavy underbrush.—Ed.]

OLIVER typewriters, advertised in GLEANINGS, have at least the advantage of a good "locality," for they're made in this county. At Sunday-school conventions I've met some nice men who were connected with the factory. [It has been said there are as many Oliver typewriters in use as of all other kinds together. At all events, all of the typewriter work in the main office and branch offices of The A. I. Root Co. is done on the Oliver machine. It is one of the strongest typewriters ever made. It is practically impossible to get it out of alignment; and while we have no financial interest in it, it is a pleasure to testify to its many sterling merits.—Ed.]

"WHY CAN NOT the bees introduce the formic acid in some other way than with their stings?" is a question propounded to me, p. 1303. I reply that most certainly they can; and just as certainly I think they do. Now, Mr. Editor, I've answered your question; please answer mine. I asked, "Does any intelligent bee-keeper nowadays believe that the acid is added 'just previous to capping the cell?'" That's what's supposed to be done according to the bulletin. I've no recollection of seeing it ever stated that the poison was introduced "just previous to capping" except by the sting; so I don't see what was in mind if not the sting-trowel theory. However, let us throw out that theory entirely. What ground is there for supposing that formic acid is introduced by the bee *just previous to capping the cell*? Don't you believe there's formic acid there before the cell is half filled? [You are asking something about which we know nothing; but we do not see any reason why the bee could not inject formic acid from its mouth parts into the cell just previous to the capping. You seem to think that the writer of the bulletin above mentioned had in mind the sting-trowel theory. He may have had, but we doubt it.—Ed.]

SUMMER of 1908 I had 18 colonies that gave 200 sections or more each. Of these,  
3 with 1905 queens averaged 217 sections each.  
3 with 1906 queens averaged 233 sections each.  
12 with 1907 queens averaged 223 sections each.

I am inclined to believe that, with a good strain of bees, a queen's second year will in general be her best.

My 4 queens that stood at the head of the list were as follows:

A 1906 queen with 276 sections;  
a 1907 queen with 266 sections;  
a 1907 queen with 252 sections;  
a 1905 queen with 244 sections.

The 1906 queen had at one time an egg in one queen-cell, and at another time a grub in one queen-cell. I don't know whether a swarm would

have issued if these had not been destroyed. Both 1907 queens would have swarmed if they had been let alone. Strange to say, the 1905 queen showed the least inclination to swarm of the lot. Just once an egg was found in one queen-cell. [Then you believe in the general principle of killing queens every two years, notwithstanding your "exceptions that prove the rule."—Ed.]

C. P. DADANT reports a visit to the wizard, Burbank, *American Bee Journal*, 300, and while there saw a patch of sweet clover on which Burbank was experimenting with a view to eliminate the bitter taste, expecting to improve the forage value of the plant. To secure red clover available for the use of our hive-bees, he advises careful watching and saving of seed from heads on which bees have actually been seen to remain long enough to gather nectar. Watch this season after season, successively sowing seed thus saved, and "whenever blossoms are found upon which bees succeed in harvesting nectar during the first bloom, the problem will be practically solved."

With apologies to Mr. Burbank for the suggestion, I would suggest a way that might hasten the last part of the process on a large scale. Indeed, it might do to start with this plan, and any farmer could follow it up without watching the bees. Harvest the first crop when any chance seed-bearing heads are near maturity, but before the plant is spoiled for hay, and in some way secure what little seed matures. Bumble-bees being scarce during first bloom, the presumption would be that at least part of the fertilizing was done by hive-bees, consequently the corollas would be short. Seed thus saved should give a crop that would show a marked increase in the amount of seed secured, and successive sowings should in a very few years give a distinct strain of plants with short corollas. The question arises whether such a strain, aside from its value to the bees, might not be desirable from the view-point of a first-crop seeder. [If there is any man who can solve this problem it is Burbank. His advice is good. But we may suggest that this is a matter that only a keen enthusiast like Burbank can work out; and if this person be given a backing of government or State funds, all the better. Possibly our experiment station will take this thing up later. We know that something can be done in the way of lengthening the tongues of bees, for something has been done; but, owing to our inability to control mating, Nature has a tendency to revert back to the old length, the standard tongue-length, or rather, we should say, the standard tongue-reach, which is about  $\frac{1}{10}$  of an inch. We succeeded in developing a tongue-reach of about  $\frac{23}{100}$ ; but we could not increase this length nor hold what we had already gained, because we could not inbreed—that is, mate a long-tongued queen with a long-tongued drone. If we could control mating (and we shall be able to do it some day), and if somebody else will reduce the length of the red-clover corolla tubes (and we believe it will be accomplished some day), we shall make available thousands of tons of nectar that are now being wasted. Any one knows, who has ever pulled out the corolla tubes of a head of red clover at the proper season, that a large amount of nectar is stored in each one of those tubes. The honey is of good quality; and, while not

quite equal to that from white clover, it would make a first-class table honey.]

We desire to lay this general problem before Dr. E. F. Phillips, of the Bureau of Entomology, Washington, D. C. He already has his hands full of other important work; but we suggest that he put it on the docket for development at some time in the future.—Ed.]

## EDITORIAL

By E. R. Root.

### CAUTION ABOUT SENDING SAMPLES OF HONEY THROUGH THE MAILS.

WE receive a great many samples of extracted honey through the mails from bee-keepers, and it frequently happens that some of these are in bad condition owing to improper packing. Persons sending honey or other liquids through the mails should be careful to use a package that will conform to the postal regulations; for it would be a calamity to bee-keepers if honey were barred from the mails on account of leaky packages damaging other mail-matter. We copy the following from the United States Official Postal Guide for July, 1908, article (2), (a) (b), page 124:

(2) Articles of glass, liquids, oils, fatty substances, dry powders as well as live bees, are admitted to the mails as "samples" provided they are packed in the following manner:

(a) Articles of glass must be packed solidly in boxes of metal or wood in a way to prevent all damage to other articles or the employees.

(b) Liquids, oils, and substances easily liquefiable, must be inclosed in glass bottles hermetically sealed. Each bottle must be placed in a wooden box filled with spongy material sufficient to absorb the liquid in case the bottle should be broken. Finally, the box itself must be inclosed in a case of metal or wood with a screw top, or of strong and thick leather. If wooden blocks perforated to contain several vials or wooden mailing-cases are used, measuring at least one-tenth of an inch in the thinnest part, lined with sufficient absorbing material, and furnished with a lid, the box need not be inclosed in a second case.

In addition to the above we would add: Be sure to write your name and address plainly on the package, so that we may have no trouble in identifying your sample. We receive many samples with no name or address, and hence it is impossible for us to tell who sent the sample.

### DOOLITTLE BOOK JUST FROM THE PRESS; HOW TO CONTROL SWARMING.

WE have had quite a call for the publication in book form of Doolittle's series of articles which we published, entitled "A Year's Work in an Out-apiary." This has now been issued from the press; and in order that all of our new readers, as well as some of the older ones who desire to refresh their memories, may have a copy, we are offering it at a very low price in combination with GLEANINGS; but the reader, in order to avail himself of this price, must renew before his subscription expires. During the long winter evenings this book will furnish interesting and profitable reading. It deals particularly with the problem of control of swarming when running for comb honey. Our edition is limited, and those who desire to secure a copy of this work before

the edition is exhausted will do well to put in their order at once. For particulars see p. 1401.

WILL THERE BE A FAILURE OF CLOVER NEXT SEASON BY REASON OF THE DROUTH?

THE editor of the *Review* seems to feel that the long drouth of the present fall has so far killed out the clovers that next year will not be very much of a honey year; that those who have fine crops of clover honey had better not sell at a sacrifice, for he thinks there is certain to be a good demand at good prices for the best quality next year.

Our brother-editor may be correct in his prognostications; but the other day we were talking with a hard-headed old farmer, and one who is a bee-keeper as well, about this very question whether the drouth of this fall had been the means of retarding the growth of clovers or killing them. Said he, "Mr. Root, you need not worry about the drouth. It will not have very much effect on the clovers. You will find," he continued, "if we get a fair amount of snow and a sufficient fall of rain next spring, the clovers—white, alsike, and red—will be very much in evidence. This has been a great year for alsike and white clover. There is a great deal of seed in the ground, even if the clovers were killed root and branch. But the clovers will stand more drouth than you think. No, sir; don't you worry about this drouth, Mr. Root. The clovers will take care of themselves."

We are giving his opinion for what it is worth. We made a little trip over some of the country roundabout, and were surprised to find that, while the grasses and weeds seemed to be dried down, root and branch, the sprigs of white and alsike clover looked green and fresh everywhere, apparently verifying the statement of our farmer friend.

We should be pleased to get expressions from our readers on this matter, as to whether drouth does affect clover. This is a *very* important question. If the clover are not killed out, as our friend Hutchinson fears, then it might be folly to hold our extracted honey over; but if, on the other hand, the general testimony is to the effect that the dry weather has done serious damage to the plants, then we ought to know the fact, and that, too, right speedily. An exact knowledge of the situation will have a tremendous bearing on the honey market. While one can not afford to carry over *comb* honey, on account of its tendency to candy before it can be sold next season, yet one might well consider whether or not he should sell his choice extracted at any price he can get before the season closes.

THE FATE OF THE RASPBERRY PASTURES IN THE FIRE-STRICKEN DISTRICTS OF NORTHERN MICHIGAN; THE HEROIC FIGHT OF THE HUTCHINSON BROTHERS.

In the last *Bee-keepers' Review* appears an article by the editor, W. Z. Hutchinson, telling some of their terrible experiences in fighting fire in Northern Michigan; of how Elmer, by dint of almost superhuman effort, time and time again was just barely able to save their property. Our readers perhaps know that Mr. Hutchinson and his brother Elmer have a series of outyards in the berry districts of Northern Michigan, where fires

have been making such fearful havoc in destroying life and property. While they managed to save their bees, their buildings, and their crops of honey secured during the past summer, yet they have lost their pasturage. The ground where the wild raspberry grew so luxuriantly has burned over once, twice, and even three times in some districts. The long drouth which preceded, and the sandy soil where the berries flourish, put the ground in such shape that it is doubtful whether the roots were protected to an extent that a new growth will spring up again in a year or so hence.

Mr. Hutchinson and his brother are thankful that they saved their bees and their crops of honey; but, as W. Z. remarked, they could have far better afforded to lose *all their bees* than to have the pasturage burned. The latter they can not replace; but the former they could have replaced by buying more.

The outlook is certainly discouraging. Mr. Hutchinson and his brother have gone to the expense of locating outyards, and building honey-houses and bee-cellars. It is reasonably certain that this investment in buildings will not be worth much for the next few years; and they will doubtless be compelled to move their bees at considerable expense to an entirely new pasture, put up new buildings, and construct new cellars. In the mean time, the capital in old buildings and bee-cellars will be tied up.

But the Messrs. Hutchinson were more fortunate than some others, who lost not only their pasturage but their buildings, their bees, and all. In some cases even their homes have gone up in smoke. GLEANINGS offers its sincere sympathy to those who have suffered loss by reason of this very destructive agent whose ravages could not be foreseen, but which, fortunately, does not visit this northern country very often.

THE EFFECT OF THESE FOREST FIRES ON HIVE LUMBER.

These forest fires that are and have been destroying millions of property all over the United States were unknown before the advent of man in that virgin country. The Indian, amenable neither to law nor any thing else, and the game-hunter, and the prodigal lumber-man who leaves brush in his wake, are responsible for this terrible destruction of property. It does seem as if something should be done. It will mean, of course, that in the near future the price of lumber will go soaring again, especially white-pine or hive lumber, for that is the timber that seems to suffer more than any other by forest fires.

TARIFF ON BEESWAX AND AN ADVANCE ON THE TARIFF RATE ON HONEY.

A RESOLUTION was passed at the last National convention at Detroit, recommending an advance on the present tariff rate on honey and a tariff on beeswax. It has been said that foreign honeys are scattering foul brood in the United States, and that there should be a sufficient tariff to prevent its importation into this country—not so much to cut off competition with domestic honey as to stop the spread of European and American foul brood just now gaining rapid headway in the United States. It is claimed that this imported honey, much of it coming from ignorant

natives of foreign countries where disease is rampant and unchecked, is now scattering disease in new territory in the United States. A tariff on wax is recommended because much of the imported article is rendered in solar wax-extractors at a comparatively low temperature, or not sufficiently high to kill the germs of disease.

It is further argued that a high price on domestic wax would redound greatly to the benefit of the producer of extracted honey, and would not affect the producer of honey in sections, because the enhanced price of the wax and dark or ill-flavored honeys would more than pay for the extra cost of his foundation.

There are a good many angles to this proposition, and GLEANINGS does not propose to take any sides; but we do say something should be done to prevent the spread of disease in this country; for foul brood and black brood—especially the latter—are spreading over this country at an alarming rate, invading sections where these diseases were never known to exist before. The old-fashioned (or American) foul brood is easily held in check by an intelligent bee-keeper; but the black (or European) foul brood is an entirely different disease. It spreads more rapidly, and seems to resist in some cases the most intelligent methods of cure. It has come very near ruining some bee-keepers, and has put others out of business.

With the advance in the price of wax, which would be inevitable if a tariff were placed on it, it would mean that the bee-keeper would have to pay correspondingly more for his foundation; but he would get more for his wax. It is argued, therefore, that one will offset the other. It has also been suggested that, with the higher price on wax, one might be able to produce it in some of the Southern States at a profit for wax only. However this may be, we can not say.

This is a legitimate subject for discussion, and our columns are open for it; but we must respectfully decline to publish any thing of a partisan or political nature involving the whole question of free trade and protection as it applies to general articles manufactured and consumed in this country. The discussion must be confined strictly to wax and honey, and, what is more, must be free from any partisan bias.

SHOULD A BEE-KEEPER MELT UP HIS OLD COMBS?  
HOW FOUL BROOD, IF PRESENT, MAY BE ENTIRELY ERADICATED BY THE PRACTICE.

DR. MILLER presents the following Straw in his regular department; but as it required a more extended reply than the limits of the space in that department would allow, we insert it here.

"It would pay any bee-keeper to melt up his combs every four or five years, and fill the frames with new sheets of wired foundation," page 1306. I wonder how many in this country believe that. I wouldn't exchange five-year-old combs for frames of foundation if you would do all the work of melting up, give me back the wax, and charge me nothing for frames of foundation. In other words, I agree with the large number who value old combs more than new.

You are speaking, doctor, from the standpoint of the comb-honey producer, and in a locality where there is no foul brood and never has been. But there are some producers of extracted honey who are beginning to question whether or not the honey from these old dark combs is of as good a flavor and color as that from newer and lighter

combs. On the other hand, it may be said there are some of this class of producers who prefer old combs because they are stronger—that is to say, they will stand a higher centrifugal force in the extractor; but if they be well wired they will stand almost any kind of intelligent extracting, even if they are not old.

But some bee-keepers are learning, to their sorrow, that *foul brood once in a locality* has a tendency to break out every now and then. They are able to keep it in control but not to prevent it appearing here and there in stray colonies. And why? Because the disease-germs lurk in these old combs; and under the right conditions foul brood will be developed from them, even years afterward.

Some have about come to the conclusion that the only way to keep the disease out of their yards is to melt up their old combs every four or five years; and if one will keep an exact account of his figures he will be surprised to see that there is no great loss in the operation, providing such combs, when emptied of honey, are stowed away to be melted up at the most convenient season of the year. Some figures bearing on this point will be introduced at a later time; and in the mean time the reader is urged not to pass judgment until these figures are produced.

For some years back we have been convinced that there is no other way to eradicate foul brood from a yard than to melt up the combs every four or five years. Indeed, we have been practicing that policy for the last six or seven years. We are this very day melting up some 300 or 400 combs, many of them good ones, for no other reason than that they are four or five years old. So far as we know they are and always have been free from disease. But we sell bees by the colony and nucleus, and we realize the very great importance to the general bee-keeping world of sending out bees on only fresh new combs, and in the mean time eliminating any possible chance of the disease breaking out, by putting an age limit on our combs. Our experience shows that the wax secured will pay for the foundation at the price the bee-keeper pays, and even for the labor of rendering, since the work may be done at a time when a bee-keeper can not do much else.

Again, there are many producers who are harboring in their yards a lot of combs containing a very large excess of drone-cells. When these are in the yard one never knows but he may be incurring a big expense by raising a lot of unnecessary drones, unless he is keeping a close watch. No, it does not pay to keep drone comb, even in extracting-supers. It had better be all eliminated and good worker comb substituted. It will pay in the end.

But right here some will say that "the Root Co. are makers of foundation. They can well afford to advocate the policy of melting up combs every four or five years." This is a specious argument against the practice, and we admit it *may* have a bad look. But we only ask the bee-keeper to conduct some experiments of his own on a sufficiently large scale and then tell us what he finds. The truth is what we want, cut where it may. Right here we may say the old-fashioned methods of old-comb rendering will not secure enough wax to pay for new foundation by a long way.

## CONVERSATIONS WITH DOOLITTLE

### QUERIES ANSWERED.

A correspondent propounds the following questions which he says he wishes me to answer through these columns:

1. Would it pay me to take a big swarm of bees, which a party here will drive for their honey, and feed them for winter? I can have them as a gift, and the time of driving will be about October 20.

I would say, that would depend, on whether you had combs to give them or not. If you had a hive filled with empty combs which you could spare to put the driven colony in, it would pay you well; or, rather, it should if nothing unforeseen happened; but if you have no combs, and have to feed to have them built, and for winter stores also, it would be a doubtful investment as late in the season as you name. With the combs, 30 pounds of syrup fed, at a cost of about \$1.25 for sugar, there should be no question about the profitableness of the matter. Better still, if you have five or six frames of sealed honey to give them, together with three or four frames of empty combs to alternate in the center of the hive where the bees should cluster, you will be almost sure of success. By this giving of sealed stores I have saved many doomed colonies in years gone by, some of which gave me from 150 to 200 pounds of section honey the following summer.

2. What is the best time to feed for winter, and how is it done?

*Answer.*—The proper time to feed when bees lack for winter stores is at the earliest possible moment after the bees cease to obtain a living from the fields, and as soon as most of the brood has emerged from the cells of the combs. This comes from the 10th to the 25th of September in this locality, and I should say feeding for winter ought to be done in September in any locality if possible. This gives the bees a chance to evaporate the feed properly and seal it over before much freezing weather sets in. For feed, combs of sealed honey have my preference; but if these are not obtainable, make a feed of water, sugar and honey, as follows: Take 15 pounds of water, putting the same in a suitable-sized vessel which is to be kept over the fire till the water boils. When boiling, 30 pounds of granulated sugar is to be stirred into the water, the stirring being done so that the sugar shall not settle to the bottom and burn before being thoroughly incorporated with the water, as is often the case where the sugar is poured in without any stirring. As soon as the whole boils again, remove it from the fire and stir in 5 pounds of extracted honey. This makes 50 pounds of feed equal to the best of honey. There are other ways of making feed for bees; but after trying all that have been recommended I prefer the above to any of them, and consider the feed enough superior to pay for any extra labor it may cost. When many colonies are to be fed, the formula may be multiplied to meet all requirements when the bee-keeper has some large vessel to make the syrup in. To feed, use feeders if you have them; but in the

absence of such it can be done very acceptably as follows: Remove the cover or cap from the hive, and use an ordinary four-quart pan. Fill it with the syrup, and put on a float of some kind to keep the bees from rushing into it and drowning. I often pull up two or three handfuls of grass near the hive and put on top of the syrup for this purpose. Now open a hole in the honey-board, or turn up one corner of the quilt a little, and set a chip from the hole to the edge of the pan, so the bees can climb up to the feed. Pour a spoonful or so of the feed down through the hole to show them where it is, and put the cover on over all, making sure that no crack is left so any robber bees can get in. To guard against robbing, it is best to feed between sunset and dark at all times.

3. What is the best thing to do when neighbors' bees are robbing yours?

*Answer.*—The best thing to do is not to let the bees get to robbing. This is quite easily accomplished by keeping none but strong colonies, and allowing each colony an entrance or doorway, according to its strength. In early spring, when robbers are the most persistent, allow room for only two or three bees to pass at a time where any colony may be somewhat weak, and give not more than two inches in length of entrance to the very strongest. Colonies so weak as to be unable to defend themselves, together with any and all queenless colonies, should be united with stronger colonies or with those having queens. If it is desirable to save a colony which has been neglected till robbing has commenced, close the entrance so only one bee can pass at a time, and leave them till near night, or till all the robbers have gone home, then go to some strong colony and take a frame having the most young bees emerging from the cells that you can find. After brushing the bees from this, insert it in the center of your robbed colony. After having done this, close the hive tightly except the entrance, so as to preserve all the warmth possible, carrying the hive to a darkened cellar. Leave it there three or four days till the robbers have partially forgotten the place and the matter, and until many young bees have emerged from the comb given. Now take it from the cellar near sunset, after the other bees have largely ceased flying, placing the hive where it stood before, and you will have no further trouble if you are careful (as you ought to be at all times) not to let the bees get a taste of exposed sweets.

4. Would bees driven out in August and put in a hive without combs or honey work as well as a new swarm?

*Answer.*—That would depend upon the honey-flow at the time the driving was done. If at the beginning of the buckwheat bloom, and the bloom were giving nectar, there would be nothing to hinder their doing well, as we often have swarms at this time which fill their hives in good condition for winter, besides yielding a surplus if the season proves good. However, if the season for buckwheat were nearly or quite over, either a driven or natural swarm would not do any thing. There are sections of our country where the asters and goldenrods, together with other fall flowers, abound, in which both kinds of swarms might fill their hives with comb and

honey so as to be fully prepared for winter. As a rule, however, all increase should be made during June and July. As to which is best, a natural or a driven swarm, good authorities differ, many claiming that a driven swarm is as good as a natural one. It is always safe to say that, for the beginner, a swarm issuing in the "good old way" is fully as well equipped for the battle of life, if not better, as they can possibly be by the interference of man.

## SIFTINGS.

By J. E. CRANE

Say, brother bee-keepers, let's just remember that robber trap described on p. 989, and make one next winter. It may be worth many times what it costs.

We are grateful for those fine pictures of Aspinwall's hive. It seems almost as good as seeing them. It may be too early to criticise them; but if he can get all those supers filled they must have some virtue.

I am not surprised at the testimonials to the value of corrugated paper in place of cleats for sections to rest on, p. 1073. I believe the more it is used the more it will be appreciated. That new shipping-case is a beauty if we may judge from the picture.

Commencing on page 1071 are three articles on grading and packing honey that will well repay any one who raises honey to read with the greatest care. They are packed as full of good things as they well can be, and no one can go amiss in following their advice. They must be read carefully to be fully appreciated.

Dr. Miller wonders if his bees place dark wax brought up from the brood-chamber between the clamps because it is too dark to cap the sections with—p. 987. Did not the bees place the dark wax on the bottom of the upper clamps before it was raised up, and then, as honey became more abundant, and wax more easily produced, use the new wax for sealing the lower clamp?

Dr. Miller also says, page 987, "Ever noticed that bees are more particular about the combs they put brood in than about those they put honey in?" I have noticed it, and thought that it was for the purpose in some way of fitting it for brood-rearing. I have sometimes noticed that, where occupied with brood before being filled with honey, some cells were left empty, as though the brood had died in them.

Dr. Miller tells us how his bees do not cluster out, although the thermometer registers 99° in the shade at 2:40 p. m., p. 987. Decidedly interesting; but are you sure that the time of the bees is wasted when they cluster outside a hive in very warm weather? Clover nectar, I believe, as a rule has to be reduced from one-half to two-thirds to make honey; and I am satisfied (as I hope to

show later) that this is a laborious task, amounting to perhaps one-third or one-half of the work of the hive. I never could see that it made any difference with the work in the house if the women sat out under a tree in the afternoon of a hot summer day; and it seems to me the bees can just as well reduce their nectar on the outside of a hive as inside—perhaps better.

On page 1005 Mr. Bassett suggests rearing a young queen over an excluder, and then, by shaking her down in front of the hive, supersede the old queen. Mr. Alexander replies by saying that it is a very difficult thing to do. I believe Mr. Doolittle advises the same method as the easiest and best one for changing from an old to a young queen. I tried it with a number of colonies the past season and found it a failure in almost every instance.

In the Aug. 15th issue Mr. Doolittle has an interesting article entitled "Closing up the Section-honey Season;" but what I wished especially to call attention to is the price he obtained for his light unfinished sections—within 2½ cents as much as for fancy. This has been my experience. We secured within two to three cents of the fancy price during the past fifteen or twenty years, and we put up from fifty to one hundred such cases, each year. I do not intend to have such sections run below three-fourths full weight; and when they sell for such a price it doesn't pay to mix it in with the best grade.

Those remarks by the editor on page 1049 on marketing honey are well worth pondering by bee-keepers. One of the things that constantly surprises me is the large number who like honey and the few who get it. They do not seem to know where to find it. Only yesterday we sent a case to New York to fill an order. Recently we had request for samples from San Francisco. Some two years ago we received a letter from a lady in Massachusetts asking for a bottle of our honey, as she had sampled some of it and was pleased with it. We wrote her, asking her to club with her friends and send for a case, as it would save freight. Well, now! that woman has sold several hundred pounds of our honey, and so it goes. We shipped several cases to the city of Washington last winter in the same way.

On p. 1047 Dr. Miller has a Straw in regard to the depth of space between the bottom-bar of the frame and the floor of the brood-chamber. I have not been troubled so much as to the depth I should like as to what I can keep. If I start with, say, ½ inch, it is sure to increase in winter when the inside of the hive is damp, and shrink in summer in dry weather; and this constant swelling and shrinking, year after year, has so reduced this space that I have had to nail cleats around the top to make my brood-chamber deeper. Moral.—Make your brood-chamber a little deeper than you want, and in time it will just suit.

On the next page, 1048, Dr. Miller tells us how queenlessness may be discovered by the way the honey is distributed through the hive. Very

good; and he might have told us that, when we find a little patch of polished cells near the center of a comb, half as large as the hand, surrounded by honey, we may be very sure we have a queen nearly ready to begin laying.

Then A. I. Root is to give us some "Health Notes." Good! There is room here for a large amount of much-needed work along these lines; and he seems to be on the right track too. It is queer that birds and wild animals should live their lives in almost perfect health, while man, the most perfectly organized of all creatures in this world, should so often live an unhealthful life of weakness and suffering. Even those who think themselves well are unable to accomplish nearly what they might if they were all they imagine they are. It ought to be a shame and disgrace to have constant ill health. How many persons we meet who seem to know about almost every thing but how to live, and die because they do not know enough to live!

## GLEANINGS FROM OUR EXCHANGES

By W. K. MORRISON

### TROUBLE FOR FRENCH BEE-KEEPERS.

The French bee-keepers have had not a little worry lately on account of the proposal now up for consideration before the local government of the department of Loiret to regulate the distance of apiaries from the highways or inhabited dwellings. At present the regulations call for bees to be located not less than 15 feet from the highway, if they are enclosed; if not, they must be 37 feet from the highway or dwelling. On the petition of 44 inhabitants of the village of d'Ascheres le Marché the prefect evidently thinks seriously of increasing this distance to 325 feet. Of course, this would impose a great hardship on the bee-keepers, and many would have to stop keeping bees. The French bee-keepers have a strong organization, and doubtless they will put up a stiff fight before they allow this proposed change to become law.

### CONFISCATION OF ADULTERATED HONEY.

Some time ago the United States pure-food inspectors seized a large quantity of adulterated honey in Detroit. It was shipped there by the Rogers Holloway Co., of Philadelphia. The Department of Agriculture immediately began action in the district court for a decree of forfeiture and condemnation. The defendant having failed to answer, the misbranded goods have been forfeited by order of the court. There were four actions—one for eight barrels of honey, one for 200 cases, one for ten cases, and another for six barrels. It was all marked "Pure Strained Honey," but on analysis by the Bureau of Chemistry it was found to be a mixture of honey, invert sugar, and glucose.

It is generally understood that this concern had been doing a large business in this kind of artificial honey. Evidently they thought they could deceive Uncle Samuel. The honey-pro-

ducers of Michigan may be congratulated on these seizures. It is one of the finest things that ever happened for bee-keepers generally, and can not help being a great benefit to the honey-dealers of the whole country.

### THE FEDERAL INDEPENDENT BEE-KEEPER.

The two first numbers of *The Federal Independent Bee-keeper*, published by Messrs. Penglase & Armour, at Bairnsdale, Victoria, Australia, have arrived here. It is certainly a very bright and lively bee-journal—not very large, but full of strictly original matter. It is edited and published by men who depend solely on bees for a livelihood, and none but original contributions appear, and that is to be its policy. Gippsland, where these enterprising men have pitched their apiaries, seems to be a fine bee country; and so, of course, the various items will be tinged with propolis and slumgum. There are twenty pages in the first and second numbers, and the September issue has two half-tone illustrations. I sincerely hope Messrs. Penglase & Armour will keep up the pace they have set for themselves. Australia now has three bee-journals, which is all that the United States has at present. Advance, Australia.

### FORMIC ACID IN HONEY.

The writer has never taken much stock in the ordinary theories accounting for formic acid in honey—least of all the sting-trowel theory of the Rev. Mr. Clarke. There is not much doubt that the formic acid is the result of the process the nectar undergoes while in the honey-sac of the bee. Burning sugar, we know, develops formic acetylene-hydrogen—one of the most powerful of gases. Sugar is itself an antiseptic, and this gas is infinitely more so. Many people burn sugar for the express purpose of disinfecting sick-rooms, with good results.

Another theory which has not much to support it is, that bees invert nectar. As a matter of fact, it is usually half inverted before the bee sips it from the flower. It inverts while in the combs, and it keeps on inverting in the bottle after it has been extracted. Of course, the temperature at which it is held in the hive helps the process and rather favors the presence of enzymes; but to say the bees do it all requires a vivid imagination.

### IRRIGATION IN MEXICO.

Old Mexico has decided to emulate Uncle Sam a little, and purposes irrigating large bodies of land by means of government assistance. To do this it will give bonuses or subsidies to individuals or companies who provide the means to irrigate tracts of land within the republic. The first enterprise of the kind will use the waters of Lake Chapala, one of the most beautiful sheets of fresh water in the world. The concessionaire is a private individual who will get \$10.00 per acre bonus from the government. Mexico is one of the finest regions in the world for bees, and large tracts of land in alfalfa will help somewhat as a balance-wheel to the bee-keeping industry by making it more reliable. The Mexican ranchero is not likely to cut alfalfa before it is ripe, neither is he likely to compete with the expert bee-keeper, so the latter will have a fair field.

Around Monterey is an immense territory very suitable for bee-keeping, which must sooner or later appeal to American bee-keepers, and I imagine it will not be long before some of our enterprising bee-men will exploit this new territory

#### THE PRICE OF HONEY IN BELGIUM.

On a number of occasions it has been noted in these columns that, in many parts of Europe, the price of honey is established by the local bee-keepers' society. In *Le Progress Apicole*, of Belgium, for October, the retail prices in various sections are announced. As they are interesting to many they are appended here. (The cost of the package is borne by the buyer.)

Section of Binche, crop rather small; price 22½ cents; wax, 36 cents. Section of Bioul, 18 cents; wax, 36. Section de Cul-des-Sarts, 22½ cents for honey. Section de Fayt-lez-Manage, 20 cents. Section de Géronsart, 18 cents. Section de Jurbise, 18 cents. Section de Maredret, 20 cents. Section de Solre-sur-Sambre, 20 cents. Section de Thy-de-Chateau, 20 cents. Section de Trazegnies, 22½ cents. Section d'Yvior, 18 cents. Section de Rosel, 18 to 20 cents.

There is nothing very arbitrary about this plan. If a bee-keeper feels he should sell his honey for less he may do so; but the prices quoted are generally adhered to, and in time buyers are satisfied. Of course, honey not up to the standard will have to be shaded.

#### LE LIVRE DE L'APICULTURE BELGE.

Monsieur Desire Halleux, of Spa, Belgium, has very kindly sent me a copy of his new book on bee culture, of which he is the author. Few men are better situated to get out a first-class bee-book than he. As editor of *L'Abeille et sa Culture* he keeps in touch with current literature. He is professor of apiculture at the Huy School of Agriculture; president of the bee-keepers' union in his section, and a counselor on bee-keeping to the Belgian government. The result is, he has turned out an excellent manual for Belgian and French bee-keepers. It has 383 pages, almost as large as *GLEANINGS*, and yet it costs only 50 cts. (postage extra). The paper and printing are both good. From the American standpoint it would not be considered up-to-date; but "*Le Livre de l'Apiculture Belge*" has some ideas well worthy of introduction into this country. It shows, for example, a robber-trap that is very ingenious and cheap. The honey and wax presses are ingenious and well built, and there are several other clever inventions illustrated. The subject-matter is extra good, showing a comprehensive grasp of the subject. It has a strong chapter on the uses of honey, which I may allude to later. One assertion is worthy of note. On page 359 it says: "Sugar is to honey what margarine is to butter." —*Rusticus*. That sentence is worthy of constant reiteration.

#### WESTRALIA.

We have received the "Fleet Number" of the *West Australian Times*, published at Perth. The special number is published, of course, as a memento of the visit of the American battleship squadron to the city of Albany, W. A. A good deal of it is taken up with a description of the

country from a settler's point of view, and a synopsis of the land laws. The latter seem to be extremely liberal—160 acres for \$20. The climate is similar to California, and the crops grown are about the same. A "land bank," owned by the state government, lends money to settlers for the purpose of improving the homestead and purchasing stock; also for clearing off the land. The country is timbered with very fine hard woods, eucalyptus being plentiful; also wattle and banksia and other famous honey-producing plants. I am under the impression West Australia holds the record for the greatest yield of honey ever reported from one colony of bees. In some years their yields are wonderful. It is an immense country, being four times as large as Texas. Potentially it is very rich, and in time ought to become one of the great nations of the earth if only a sufficiency of the Caucasian race of men settle there. An American farmer would probably feel more at home in West Australia than any other foreign country in the world. Every thing seems to be managed on American lines, and the people are sincere admirers of the great republic of the west. They are equally optimistic and democratic. More details can probably be obtained from the Colonial Secretary's Office, Perth, West Australia, by any one who has an idea of going there to settle.

#### PARCELS POST CRITICISED.

A friend who keeps a hardware store at Wilbur, Nebraska, sends me a very courteous criticism of my stand on the parcels-post question, and in addition he incloses a pamphlet written by C. W. Burrows, one of the largest booksellers in the United States. Mr. Burrows' article I have read before, and, so far as I am personally concerned, his arguments have no weight, because he denounces mail-order concerns when he himself does a very large mail-order business in books. Of course, he pays only 8 cents per lb. postage on books. If he had to pay 16 cents it would probably make quite a difference in his attitude. Furthermore, many of his statements are not true. In Europe there is a parcels-post service in every country, and from one country to another; and, though it has been working for many years, it has not had the effects he says it will have in this country. Just the contrary is the case. Country merchants in Europe like parcels post. They do a lot of business by catalog. There, when a man steps into a country store where hardware is sold, and inquires for an article, the merchant does not send him away, but tells him he can get it for him in 24 hours. He orders it sent straight from the wholesale house to the customer, so he never sees it. He makes a profit just the same. Let us suppose a case. A bee-keeper in Nebraska goes in a great hurry to a hardware store and inquires if they have a little comb foundation or a few sections. The merchant says, "No, but we can send them to you in a day or two if you will leave your order." The bee-keeper goes home, and in less than two days the mail-wagon leaves the goods at his house. It is the same in every other kind of business, and very much so in the case of hardware, for no country dealer can afford to keep a complete stock. He keeps a full set of catalogs, however.

Mr. Burrows claims the mail-order business would build up the cities; but it has not done so in Europe. I know many people move to the towns so as to get more comforts. They want the daily papers; they want fresh meat every day, and many other things which they can not get. It is a very common occurrence in Europe to see butter, eggs, honey, flowers, fruit, etc., sent by parcels post. I have repeatedly seen meat sent by the same means. It strikes me this is a good thing, and I firmly believe it will be a great day for bee-keepers who sell their honey to consumers direct when parcels post is allowed by Congress.

Please do not think I imagine all this. Only a few days ago a gentleman who keeps a drugstore here in Medina issued the following circular. It speaks for itself.

*Dear Friend:*—We wonder if you know how easy it is to order drugstore goods by telephone or mail. Since the rural routes have been established in this section of the country many of our old customers who formerly waited until they came to Medina to buy drugstore goods are now ordering by phone or by mail, and having the goods delivered by rural routes. You will find the system works very nicely indeed; for instead of waiting days or weeks for storms to blow over, etc., for goods of which they are very much in need, they are able, by the new plan, the R. F. D.'s, to have things delivered the next day.

We should be glad indeed to have you keep this in mind; and if you are in need of any drugstore goods in the near future, write or phone us, and you will find we will take care of your order just as carefully and just as promptly as if you yourself came personally to our store.

The writer of the foregoing has a store in a country village, and it is very clear to me that parcels post would enable him to extend his business considerably, as 16 cts. a pound is too much to pay for goods delivered on a rural route. Every country storekeeper should be, in my opinion, a strong advocate of parcels post. It is bound to help him. The Postmaster-General intends it shall help him, and he will help him if he gets a chance to do so.

#### CARPET WEED.

The *California Cultivator* recently gave space to the following query from a correspondent:

I read an article in a recent issue of the *Cultivator* regarding *Lippia repens*, a creeping lawn-plant. Where can I obtain a start of it? Will it spread and become a pest? Is it a forage-plant for stock?—W. E. A.

In answer to the above the editor replies:

We should think you could secure this plant from your local nurseryman; but if not, the Southern California Acclimatizing Association, Santa Barbara, which originally introduced it, or probably any nurseryman advertising in these columns, can supply you. It will not become a pest, and is easily eradicated if desired. While it has been claimed to be a strong enough grower to eradicate morning-glory, we do not know whether it would do that or not. It would surely need encouragement by keeping down weeds until it is thoroughly rooted. In the yard of the writer it has proven very attractive to poultry, which run to it immediately on being let out of their corral; but as to whether stock would find it agreeable, or whether it would live under grazing, we are not prepared to say.

This lippia is a splendid honey-plant—few better—and is, in addition, a soil or sand binder, creeping over the loose sand and covering it with a mantle of green like a carpet. In Florida it would be a grand acquisition, and thousands of dollars could be profitably spent in getting it started there. It is fair for stock. If it would take hold of Florida land as it does some others, the "land of flowers" would become one of the leading honey States. Every Florida bee-keeper should try it.

## GENERAL CORRESPONDENCE

### WHAT HIVE TO ADOPT.

A Discussion of the Merits of Different-Sized Hives, Taking into Consideration the Man, the Methods, and the Locality.

BY E. D. TOWNSEND.

The proper hive to use is a question that confronts every beginner. The kind, size, and shape of the hive best adapted for the purpose must be taken into consideration, and these depend upon whether comb or extracted honey is produced; whether the colonies are all in one yard or in several outyards, etc.

In reading the current literature on the subject, much confusion of ideas is noticeable; for in some locations, where conditions ought to be the same, one bee-keeper will use a large hive and the other a small one, each being successful with his own preferred size. This reminds me of a little incident that came up in our convention at Saginaw. Mr. W. J. Manley, of Sandusky, told of buying about 60 colonies of bees, one of which was in a soap-box. This soap-box colony was inverted, an upper story put on, and, although the colony was handled the same as the others, several more pounds of honey were extracted from it than from any other individual colony in the yard. This only goes to show that bees will store honey in almost any kind of hive; and, further, that a hive poorly proportioned can be so manipulated as to yield fair results in the production of honey. But in this case it is, of course, the man and not the hive that should get the credit. In this article I propose to fit the man to the hive, the hive to the man, and both to the location.

It has been my fortune (or perhaps misfortune) to be the owner of almost all kinds and sizes of hives, including the ten-frame Gallup and the ten-frame Quinby—hives varying in size from 1000 to 1800 square inches of brood-comb space. I have also had the eight, ten, and twelve frame Langstroth hive; and many times different sizes and styles of hives were in the same yard. My experience with such has extended over many seasons, so that I am in condition to know which size and style are best adapted to my locality and to my particular system of management, etc.

Probably two-thirds of the colonies in this State are in eight-frame Langstroth hives, or in hives similar in size and shape. In general we may say that, the further north the bee-keeper is located, the shorter his honey season. A short season requires a small hive for the best results in the production of honey; and a small hive requires the more constant care. A large hive will stand more neglect.

Our location is one where the surplus flow is early and quite short, it being mainly from clover and raspberry. This flow usually begins about 60 days after the first natural pollen is brought in. The best flow is apt to come after a rigorous winter, and then the skill of the expert

is needed to bring the bees through in good condition, and tide them over the ever changing days of spring. All admit that an eight-frame Langstroth hive is large enough to allow a colony of bees to build up to a normal size during this time *when circumstances are favorable*. Now, if it takes all the skill of the experienced bee-keeper to manage his bees so they will come through the winter and spring in the best condition and take care of the surplus honey in general, what can be expected of the inexperienced, careless, or indifferent bee-keeper? It is evident that the eight-frame brood-nest is ample for such, as there is no object in having more frames if the bee-keeper is not able to get the colony built up safely to occupy them. The eight-frame is ample for the beginner; but when the knack of successful management is acquired, so that at least half of the colonies, by the time the honey-flow begins, fill their hives to overflowing with bees, a larger hive—that is, a ten-frame size—must be used. If the beginner were to start with a twelve-frame hive it would be my opinion that he had begun at the top of the ladder instead of the bottom, and his failure would be almost certain. The change from the ten-frame size to the twelve-frame size may be advisable whenever one has mastered the situation, so that the ten-frame hive has become too small to hold his colonies at the opening of the flow. The location must always be considered in this connection; for if the main honey-flow began only 90 days from the time the first natural pollen is gathered, a hive with at least two more Langstroth-sized frames could be used than would be advisable if the main honey-flow began only 60 days after the first pollen was gathered in our location here.

Mr. S. D. Chapman, of Mancelona, Mich., is one of the most successful bee-keepers in Michigan, as he has bee-keeping "under his thumb." He winters his bees in four cellars, and brings them through the winter and spring very strong, so that, long before the 60 days breeding season is ended, he is obliged to allow additional room for the queen to lay, and also for clustering space in order to keep the bees from swarming before the honey-flow. Two of Mr. Chapman's cellars are under his dwellinghouse, a third is an elaborate special repository, and the fourth is one not so expensive. One of the cellars under the dwellinghouse is under a part of the house where a fire is kept going most of the time; and these colonies must be set out in the spring earlier than any of the others. All of this shows that the man and not the cellar should have the credit where the colonies are successfully wintered in four cellars of different design and construction, necessitating different methods of handling, etc.

Good wintering in the northern States is one of the supreme tests of a successful bee-keeper; and the inability of many of the northern men to winter their colonies so they will breed up and fill large hives in the short period between the breeding season in spring and the main flow in June is the reason that most of them prefer a small hive.

For 18 years I had 50 ten-frame Quinby hives in use. These were chaff hives with the regular thickness of packing around the sides, top, and bottom in winter; but the best I could do was to get the colonies in these large hives in condition

for the honey-flow about July 1, when in our locality the white-clover flow would be nearly over. At the same time I was having good success with the thirteen-frame Gallup hive, and so I took out the two outside frames of the Quinby hive, reducing it to the eight-frame size, which equaled in space the thirteen-frame Gallup hive, except that the frames ran the other way. These two hives gave good results, and I patterned after this same size when I adopted the ten-frame Langstroth hive.

I do not mean in any of the above that I prefer the eight-frame hive. It is true that I said that the eight-frame Langstroth hive is large enough, and that it needs less care, and some may wonder why I use the ten-frame hive. I will try to explain the reason. It sometimes happens that we do not see our colonies from the time they are taken out of the "clamps" until it is time to put on supers, and in such a case all must be fed enough in the fall to make a total of from 25 to 30 pounds of stores, to make sure that none starve during the spring when we do little if any feeding. Our colonies use from 20 to 25 lbs. of stores from October till the main honey-flow in June. At the time of the main honey-flow, there will be from 5 to 10 lbs. of stores left in the hives which have contained 30 lbs. in the fall, and from nothing to 5 lbs. in those hives which contained 25 lbs. in the fall, the calculations being based on good average colonies—weak colonies consuming less. Now, a Langstroth brood-comb contains 5 lbs. of honey and bee-bread when sealed; and 30 lbs. of stores will, therefore, fill six brood-combs spaced  $1\frac{1}{2}$  from center to center; so that in an eight-frame hive there will be only two empty combs left in the fall. A colony wintered fairly well in such a hive will become honey-bound before the main flow the following June. It would have been in better condition at this time if there had been a comb or so of stores left. On the other hand, the ten-frame hive with 30 lbs. of stores would have *four* empty combs in the fall; which combs, together with those from which the honey is used during the winter, would make ample room for the queen to lay and still allow a "reserve fund" consisting of a comb or more of honey at the beginning of the honey-flow in June. For this reason, therefore, we prefer the ten-frame hives.

Remus, Michigan.

*To be continued.*

## CAN WE DISPENSE WITH SEPARATORS?

### Why Many Bee-keepers Prefer to Produce Bulk Comb Honey.

BY LEO E. GATELEY.

Unless acquainted with the facts, one might, from all that has appeared upon the subject, be easily led into the error of thinking that the production of bulk comb honey is a part of bee-keeping confined exclusively within the borders of Texas. From actual conditions nothing could be further from the truth. A large part of the Arkansas crop has always been put upon the market in this form, and, to a great extent, it will be found very much in evidence throughout the South.

Though, perhaps, the cause for this method of marketing having become so universal in our State seems too often a result of carelessness, to the careful observer, another cause is visible which producers in many parts of the South can not afford to ignore. This is the difficulty often encountered here to a degree seldom found in more favored localities, of getting the best work done in section supers on account of peculiarities in the flows.

During a season of our prolonged flows, the bees, if rightly managed, will store as much honey as can be secured in the average locality; but seldom is the flow sufficiently heavy for bees to work in supers as they will in a good basswood region. During such slow flows the bees are greatly inclined to crowd honey into the brood-chamber rather than in any sort of surplus arrangement. As separators accentuate this inclination, I have been for some time endeavoring to eliminate these from our supers, and I have met with a measure of success. Most bee-keepers recognize the importance of having free communication in supers; but to avoid the annoyance and discomfort of having irregular and bulged sections the majority prefer to use separators, even at the expense of a few pounds of honey.

In this connection Mr. Sherburne, p. 947, Aug. 1, presents an article at once interesting and instructive. Like him, we have learned that the secret of getting cratable honey when no separators are used lies in having most of the sections started upon simultaneously. Also, to accomplish this result, too much space must not be left in the brood-chamber when sections are put on.

Bait-combs, when used in supers not having separators, can not be placed haphazard, as they will be widened considerably at the expense of adjoining sections before those containing foundation have been worked upon. The only satisfactory way is to use a row or two of these along each side of the super.

Comb-honey supers as now constructed, while being the source of frequent complaints, generally allow greater convenience for the man than for the bees. In localities similar to ours, many who started in to raise section honey have gone back to producing bulk comb honey for no other reason. I can not but realize the great disadvantage bees are compelled to labor under in ordinary supers; and another year, notwithstanding preconceived ideas as to how section honey ought to be produced, no separators will be used in our apiary.

That more honey can be secured if we dispense with separators has been demonstrated over and over. When bees do not enter the sections readily, but crowd the brood-nest with honey, the working condition of a colony is rapidly impaired. Even with our divisible brood-chambers, I have seen honey crowded into the brood-combs until but two or three shallow frames remained for the queen. For a colony to remain populous is impossible under such circumstances.

The past season some 2000 1½ Danzenbaker sections, having beeways, were used in our apiary, without separators, and never before did I see so clearly demonstrated the necessity of having supers so arranged as to meet the natural requirements of the bees. On two sides of these, bee-

ways were cut their entire width, so that the wide frames, in which they were used, might be made with plain top and bottom bars, yet leaving no part of the sections exposed. No separators are required for so thin a section, and we find that, when disposing of honey, a full section that can be sold for a dime moves off more rapidly than one weighing a full pound.

Contrary to the opinion expressed by the editor on page 1079, though the sections above mentioned were open on but two sides, there were no uneven combs or bulging. Undoubtedly there would be an advantage in having them open all around, but we have not found this to be absolutely necessary.

If compelled to use separators, Mr. Sherburne says he would abandon comb honey and produce only extracted—exactly what most bee-keepers would advise for a locality like ours; but the environments of all are not such that this can be made profitable, and such conditions here exist. If necessary we can fall back to the bulk comb, though as yet no occasion has arisen why a change to either would be advisable.

Ft. Smith, Ark.

## GRADING AND CASING COMB HONEY.

### How the Work is Rapidly Done at the Apiary of M. A. Gill; Further Particulars Concerning the Record Casing.

BY G. C. MATTHEWS.

The various articles appearing in GLEANINGS for the past few years concerning the rapid casing of honey have interested me somewhat, and have likewise furnished me some amusement; for, having been intimately associated with M. A. Gill for the past three seasons, I have been in position to understand what honey-handling really means, and to be able to refute those articles which, by covert innuendo, cast discredit upon the article of Mr. F. J. Farr, in GLEANINGS for December 15, 1907.

Now, that which Mr. Farr saw, which surprised him as much as it does some of his readers, is a thing of not uncommon occurrence in Mr. Gill's casing-room. There are many days every August when Mrs. Marian Fuller, of Beloit, Wis., cases just as rapidly as she did on that warm day when Mr. Farr was her waiter, though she does not frequently case so many hours.

In all this honey business the super that predominates is one of Mr. Gill's own invention, although, like others, we have several other kinds. This super is of standard eight-frame dimensions except in depth, it being deeper so as to accommodate ⅝-inch slats; but it has no section-holder. The slats are nailed fast to the end pieces in the super so that there are as few loose pieces as possible—only the follower and the separators. The pattern-slats are also a little wider than section-holders, and the separators rest on top of them and not between them.

When casing, the supers are taken from the pile by the waiter, and the tops of the sections are scraped clean with a cabinet-scraper or a piece of glass. Then the follower is taken out and

the super is ready for the caser, no sections having been loosened in the super in any manner.

Now each caser places two cases in front of her on the table, one for No. 1 honey, the other for No. 2, and lifts a super up in front likewise. The sections she loosens from the super with her casing-knife, made especially for casing; and, without changing her grip on it but once, she scrapes all four sides and four edges clean of propolis. Meanwhile she has determined its grade; and just as soon as she has it clean she places it in its proper case. In all our work a section of honey is never handled, except this one time, from the hive to the car. Does it look impossible to handle  $5\frac{1}{2}$  sections of honey in a minute the way I have described? and does not this method look more sensible than putting honey in curing-crates, or dumping a wheelbarrow load out on a bench at once, as do our T-tin friends?

After the cases are filled, the caser may nail on the cover if the assistant is busy, but usually the waiter does it. However, the caser gets her own cases, and adjusts her own drip-sticks, sometimes even waiting a short time for cases to be made.

For the benefit of those who think 125 cases can not be filled in a day if the honey is properly cleaned and graded, I will say that Mrs. Fuller cuts a thin shaving off the edges of unusually soiled sections, exposing a clean white wood. Can they be cleaner? In handling empty supers I have seen hundreds containing little shavings, showing her handiwork.

Concerning the grading, I have weighed dozens of No. 2 cases that weighed up to the No. 1 standard, but never a No. 1 that fell below; and I think any buyer of this honey will testify to its quality.

It seems to me very strange that any one who lays claim to being a caser at all can not case more than twenty cases a day. Mrs. Fuller, I know, could easily average four times that many daily, and still have time to attend to housework. Longmont, Colo.

### UNCAPPING-KNIVES.

#### A Very Sharp Thin Knife Preferred Without Heat of Any Kind.

BY T. P. ROBINSON.

Referring to the discussion of uncapping-knives, page 1126, I will say that I never used any but the cold knife to any appreciable extent, and would use no other kind. I have tried knives from boiling water, and found them nuisances so far as I am concerned. In any case, the edge must be sharp and thin, and this would cool just as soon as coming in contact with the cold honey, and cut no better than a cold knife. Then if the body is boiling hot it will melt the wax and make a mess. Then the operator is constantly putting water into the honey from the knife, as a freshly heated knife has to be used on each frame. I don't want any foolishness like this in my extracting-house.

I never have any trouble with my cold knives on any kind of honey that I produce, and I have

uncapped it after frost when it was so thick that I could not get over two-thirds of it out of the combs. I keep the cutting edge as keen as a razor, while the other edge is kept moderately sharp to clean burr-combs from the top and bottom bars. The knife is ground to a long keen edge. If it is hard, the temper is drawn to a moderate degree of hardness (this drawing of temper is easy, as I am a steel-worker), and the edge kept sharp by the edge of some other knife of a high degree of hardness, usually a pocket-knife, or steel made for the purpose. The sharpening is done by a shoving process of the blade in the same manner a boy smooths a stick, except that the strokes are made in one direction. This method puts an edge on the knife far superior for uncapping to that made by any stone, since the edge thus put on is in miniature waves, similar to those on a bread-knife, and if the knife is drawn at an angle over the comb it will do the work so easily and smoothly that the operator will wonder how any knife can do so well. I have occasion to sharpen a knife only once for each 1000 lbs. of honey, and sometimes we run over a ton per knife at one sharpening. We did that several times this summer. It takes about 30 seconds to sharpen a knife in this way.

#### HONEY SOURING IN THE HIVES.

We notice that the editor, page 1139, asks some one to give a reason for honey souring in combs as in the case of Mr. Henry Perkins, Calexico, Cal. I have had trouble along this very line. It is entirely due to bees gathering too much nectar heavily charged with water. This is always prominent in the first nectar secretions of plants, and is greatly augmented by damp or wet weather conditions. The fact is, the bees gather more nectar than they can evaporate into honey. I have had my combs swell up and burst open for this same reason. In my case the remedy is simple and easy. Keep only the rousing big colonies that are able, with their heat and fanning, to cure the nectar into honey. Unite weak colonies, or contract the bees on few combs. The trouble is most pronounced in weak colonies and those having too much comb space. I have had no trouble along this line since I found out the true reason. This manipulation is necessary only when the weather is damp. Weak colonies will not be affected with sour honey if the nectar is well cured in the field.

Bartlett, Texas.

#### A SHARP COLD KNIFE PREFERRED.

I have been using uncapping-knives for thirty years. I never heated one in my life. I whet them as sharp as a razor, then polish the rest of the blade on a pine board. I have no trouble from the knife mashing the cells down. I cut both up and down.

J. S. MCFANICK.  
Columbus, Kan., Sept. 27, 1908.

[Several of our correspondents have of late favored a cold uncapping-knife rather than one that is hot. We have not had a large number of reports on this point thus far. We should be pleased to hear from many others. Let us know the condition when a cold knife is better and those under which a hot one gives better results. Or is it possible that a keen-edged cold knife is always better than any hot knife?—ED.]

FIG. 1.—MR. AND MRS. CHALON FOWLS, OF OBERLIN, OHIO, AND THEIR FAMILY OF GIRLS WHO DID PRACTICALLY ALL OF THE WORK IN EXTRACTING THE CROP OF NEARLY TEN TONS.

### CAPPING-MELTERS.

**Further Particulars in Regard to Melting Cappings as they Drop from the Combs; an Introduction to the Home and Apiary of Chalons Fowls, Oberlin, Ohio.**

BY H. H. ROOT.

From time to time in our columns mention has been made of capping-melters—that is, uncapping-cans arranged in connection with heat so that the cappings are melted as they are sliced from the combs, leaving nothing at the end of a day's work but the honey, the melted wax, and the small amount of refuse. During the past season we spent considerable time in developing an apparatus that would be practicable for all bee-keepers; and since it was evident that no plan of this kind could be given a fair test on a small scale we appealed to Chalons Fowls, of Oberlin, Ohio, who very kindly offered us the use of his extracting-house during the time that he was extracting his crop of nearly ten tons of honey. The cappings from the entire crop were run through a capping-

melter, although several different constructions were used before the final form was decided on.

Mr. Fowls' daughters, with the help of the gasoline-engine, do practically all of the extracting. The up-to-date method is followed of leaving the honey on the hives until the flow is about over and then hauling it to the home yard to be extracted. This plan gives the very finest honey that can be obtained, and permits the use of bee-escapes to get the bees out of the supers. These escapes are put on, and all the full supers are removed easily and quietly a day or two later without disturbing the bees in the least. The honey is hauled by wagon to the extracting-house, where it is extracted load by load as it is brought in. Very often the honey was so cold when it was extracted that it was thick and waxy; but the combs were left in the extractor until the cells were comparatively dry. When turning an extractor by hand, it is very hard to do thorough work unless the cold honey is warmed by artificial heat.

The building in the background of Fig. 1 is the extracting-house, the interior of which is shown in Fig. 2. When fast work is being done,

FIG. 2.—THE INSIDE OF THE EXTRACTING-ROOM.

The honey is strained into round cans holding 75 pounds each. These are stacked up around the walls of the building.

two of the young ladies do the uncapping while the third handles the combs, and loads and unloads the extractor, etc. As soon as the empty combs are taken out of the extractor they are replaced in the supers ready for the next year. At the extreme left the capping-melter is shown with a pipe at the bottom, conveying the wax and honey into a large pail on the floor. This particular melter was made square, as it was at first thought that the square form was the better. Over it an empty super was placed on which the cross-pieces were nailed to hold the frames while the combs were uncapped. The uncapped combs were placed directly in a large can in which a coarse screen was supported several inches above the bottom on which the combs rested. The honey that dripped down from the combs was thus always out of the way; and when too much honey accumulated the screen was removed and the honey poured directly into the straining-tank.

As will be noted, the honey was drawn from the bottom of the extractor into a pail and poured directly into an Alexander strainer shown on page 27, Jan. 1st GLEANINGS for 1906. Mr. Fowls found this arrangement for straining the honey the best and most convenient of any kind he ever tried. When the fine wire cloth of one pail is clogged with bits of cappings until the honey does not run through rapidly, another strainer is set over the can while the first one is cleaned with a flat stick or knife.

The honey is drawn from the bottom of the straining-tank directly into round cans which hold 75 pounds. A piece of paper is laid over the top, and the tin cover crowded down. These cans, as shown in the illustration, are stacked up around the edge of the room. The photograph was taken when about half the crop was extracted. Toward the end of the season the cans were piled up nearly to the ceiling. This plan necessitates considerable lifting; and Mr. Fowls, for another year, is planning to run the honey directly from the extractor through a tin pipe into a tank in the basement of his home.

The out-apiaries are located along the electric-car line east and also south of Oberlin. One of these yards is shown in Fig. 3. It will be noted that a high board fence is built along the west side in order to shelter the hives from the cold winds in the winter. The apiary is located in an orchard. In this view, by the side of the honey-house, is shown a Boardman hive-carrying cart which Mr. Fowls has found to be very useful. Although trips can be quickly made to any of the yards on the cars, the honey is hauled back to the extracting-house by wagon.

A very ingenious arrangement is shown in Figs. 4 and 5 for catching the drip from the supers. As will be seen, a large tray just the size of the wagon-box was made, the edges of which are turned up about an inch. This is placed in the bottom of the wagon, and the supers piled on it. Since

most of the hauling is done after the honey-flow is over, there would be danger of having the horses stung if robber bees were continually working around a wagon-box daubed with honey; but the use of this tray prevents any such danger, as it is removed as soon as the honey is unloaded, and placed out in the yard where the bees can

clean it up. In this way the wagon is always clean, and there is no loss of time in any way. The tray may be slid out of the back of the wagon when the end piece is swung down.

The Beuhne capping-melter, mentioned pages 560, 626, and 802, is somewhat similar to the other devices that have been described, except that square pipes holding hot water are arranged over the main can. The cappings fall on these pipes and are melted. The plan was found to be defective on account of the fact that the space between the hot pipes so soon became clogged with refuse, necessitating frequent cleaning, which consumed time. Furthermore, the Beuhne apparatus is very expensive; and it is difficult to keep the tin pipes from leaking, as there is constant

FIG. 3.—ONE OF MR. FOWLS' OUTYARDS, LOCATED NEAR THE ELECTRIC CAR-LINE.

Notice the high board fence which shelters the yard from the prevailing winds.

contracting and expanding due to the changes in temperature, and we therefore turned our attention to a simpler apparatus. We tried a shallow pan, but soon found that it was not suitable, for the reason that it required so much heat to melt the cappings fast enough that there was danger of injuring the honey. We therefore kept enlarging the double pan until we had a can about 16 inches in diameter and 15 inches high. This held the accumulated cappings and honey until the wax had a chance to melt slowly and run out of the gate at the bottom. We first tried a tilting outlet pipe which could be raised up to allow the melted wax and honey to accumulate in the can, the idea being to leave the wax inside the capping-melter, drawing simply the honey off at the bottom. However, we found that

when this plan was used, the honey remained so long in contact with the heat that there was danger of injuring the flavor. We therefore substituted the plain honey-gate, which allowed the honey and melted wax to escape immediately.

The form of capping-melter finally decided upon is shown in Fig. 6, the details of which are made quite clear by the illustration. The apparatus is simple, for it consists of only a can within a can, the inner one being an inch smaller in diameter, and  $\frac{1}{2}$  inch shorter, which allows a space of  $\frac{1}{2}$  inch between the sides and bottoms. A single-burner gasoline-stove keeps the water hot enough to melt the cappings when the honey is extracted at the rate of about 200 pounds an hour. When faster work is done it is probable that a larger can would be needed to be placed over two burners. Oval-shaped cans could be used similar

FIG. 4.—FOWLS' REMOVABLE GALVANIZED TRAY FOR THE BOTTOM OF THE HONEY-WAGON.

FIG. 5.—THIS TRAY CATCHES ALL THE DRIP, LEAVING THE WAGON CLEAN, SO THAT THE HORSES ARE NOT IN DANGER OF BEING STUNG AT ANY TIME BY ROBBER BEES.

to wash-boilers, with the strainer and gate at one end.

It will be seen in the illustration that there is room between the two cans for the blade of the uncapping-knife, so that those who desire to use a knife heated by hot water may do so without any additional tank or apparatus. However, we did not find that it facilitated matters to keep one knife in hot water while the other was being used for uncapping the combs. The difficulty was that the honey chilled the knife before more than two or three inches of the comb had been uncapped, and then the wax, which had been melted when the blade first touched the comb, hardened and made the knife gummy, and hard to handle. Usually we preferred the cold knife kept sharp. During the last day or two, however, we used a steam-heated honey-knife very successfully. Such a knife does not become cold when pushed through the honey, and both the honey and wax run off the blade directly, leaving it clean all the time. There is no question that a hot blade is more easily pushed through the comb than a cold one.

Figs. 7 and 8 show somewhat better the construction of the can. Two screens are used to strain the wax and honey. As will be seen, these are slid into place directly over the opening leading to the honey-gate. The coarser screen is used outside, and is made of wire cloth having about four wires to the inch. The inner screen is finer, being made of wire cloth the same size as that used for window-screens. These may be quickly slid in or out, so that, after the work is done, it is easy to remove them for the purpose of cleaning the can. The use of these screens was first suggested by Mr. Fowls in order to keep the refuse from running out with the wax and honey; and they serve the purpose admirably, the honey being so clean that it may be poured directly into the main tank or can without further straining. The wax is also very clean, the cakes hardly needing to be scraped. The wax has a very good lemon color, and is practically as light as that obtained from the solar extractor, and just

as clean or even cleaner. The honey is not injured in the least, for it does not remain long enough in the can to get very hot; in fact, the cold honey and cappings falling continually into the can keep the water so cool that the wax barely melts, and it is possible for one to hold his finger in the stream running from the gate for a few seconds without burning it. As will be seen in Fig. 6, the honey and wax run together into a pail or can standing below, which is provided with a gate at the bottom, from which the honey is drawn as fast as the pail is full, care being taken, however, not to keep the gate open so long that the wax runs out. In this way the wax can always be kept on top of the honey in the pail. We found that an ordinary pail would hold the cappings from a whole day's run; but in case the work

FIG. 7.—THE CAPPING-MELTER TURNED UP TO SHOW THE CONSTRUCTION.

There is  $\frac{1}{2}$ -inch space between the sides and bottom of the can, making room for about a pail of water.

FIG. 6.—THE NEW CAPPING-MELTER.

The apparatus consists of a can within a can, the space between holding the hot water. The melted wax and honey pass through the strainer, and directly out of the gate at the bottom.

FIG. 8.—THE STRAINERS REMOVED.

These slide loosely in or out to facilitate the cleaning of the can. At the bottom the opening is shown leading to the gate.

were done so rapidly that too much wax accumulated in the pail it could be dipped off the top into a shallow vessel to cool. Another plan is to run the honey and wax into a large can, which, when full, may be set aside and another one placed under the gate of the melter. This method is all right except that it is necessary to have a number of cans standing around in the way containing honey, with an inch or so of melted wax on the top.

The apparatus described in the May 1st issue, page 559, by J. Y. Peterson, is a plan somewhat similar, except that the cappings and honey must flow over a long heated surface, and in our opinion there would be greater danger of injuring the flavor of the honey by such a process. It will be seen in the form we have developed that much of the honey can run out of the gate at the bottom without becoming heated to a great extent by long contact with the hot sides of the can.

When we first showed Mr. Fowls the plan of melting the cappings he was skeptical about having a gasoline-stove, etc., in the honey-house, thinking that it would be inconvenient to have so much apparatus around; but he is now of the opinion that a capping-melter is a great convenience, and that the simple apparatus needed is really less extensive than that which would be needed to hold the cappings in the old way, allowing the honey to drain out. It is certainly surprising how small an outfit is required to do so much work. Besides melting cappings, the double-

jacketed can is just the thing for liquefying honey, either comb or extracted. The strainers may be removed, leaving a first-class liquefying-tank, which may be used over any stove without danger of injuring the honey, since the hot-water heat can be so nicely regulated.

### CAPPING-MELTERS.

#### An Efficient Home-made Device for Melting the Cappings.

BY HARRY LATHROP.

I have been much interested in what has been published regarding devices for melting cappings when extracting. I doubt very much if any one can succeed in forcing bee-keepers to pay for the right to use a principle which has been common, as the editor mentions, in the operation of the German wax-press.

In my experimenting I began by placing the cappings in a flat-bottom can that had a faucet at the bottom. I placed the can on the stove, but raised it up half an inch or so by placing small pieces of iron under it in order to provide an air-space between the can and the stove. The faucet being left open, and projecting over the edge of the stove, the melted wax and honey ran out into a pail. It worked, but not perfectly. The honey was somewhat discolored from overheating. After reading of Mr. Mercer's plan I had the tinner fix a melting-pan by taking a large stamped tin dishpan, placing one a size smaller in it and connecting them together with braces, leaving an inch space between them on bottom and sides for water. A half-inch copper tube reaches from the bottom of the inner pan through both pans, and projects eight inches. In use, this double pan, with inner space filled with soft water, is set directly on an ordinary cheap gasoline-burner. A comb-rest is provided by means of a piece of pine board run through the handles of the pans. A small nail driven through from below makes a point to hold the frame while uncapping. The stove is kept burning continuously while extracting; and if it does not quite keep up with the work it can be left burning during the noon hour or after the day's work is finished. I can see no danger from leaving it, but be sure that the pail under the spout is large enough to hold the contents of the pan. It works finely, and I see no need of anything better. The wax and honey run out into a pail, but there is a certain amount of slumgum that will accumulate in the pan. This is kept from running out by means of a piece of tin notched on the under side, set about  $\frac{1}{2}$  in. back of the spout. After the pan has cooled, this slumgum can be peeled out in the form of a cake, to be run through the Hatch-Gemmill press if the bee-keeper is so fortunate as to possess one of those desirable machines.

Any machine devised to use any more heat than I have indicated, or any plan to run the honey over a larger heated space, will injure it. The honey must run out freely as soon as melted, and one should use the minimum of heat. We now have no cappings on hand to bother at the close of each day's extracting.

In producing extracted honey we tier up several stories high if necessary, placing seven combs

in an eight-frame body. The combs are mostly sealed when we extract, and very heavy. We cut down to the frame in uncapping, thus securing a large amount of wax and leaving the combs in nice shape for future use. We have always a set of empty or partially filled combs next to the brood-chamber to catch the green honey, and thus avoid getting any of it into the extractor. This new way of getting rid of the cappings I consider a great improvement and one that will come into use rapidly.

Bridgeport, Wis., Aug. 19.

[It may be well to state that both Mr. Lathrop and the editors of GLEANINGS were working on this plan independently until the above article was received in August, showing that Mr. Lathrop had arrived at practically the same conclusions in regard to the plan.

Mr. Lathrop and Mr. Fowls soon saw the importance of allowing the honey and wax to escape as soon as possible in order to increase the capacity of the can, and to prevent any danger of injuring the honey.—Ed.]

## OUTDOOR WINTERING.

### Holes Cut Through the Combs to Permit an Easier Passage from one Part of a Hive to Another.

BY C. O. FLUHARTY.

My bees are all in regular ten-frame hives, well filled with solid slabs of honey, sufficient to winter three ordinary hives of bees. However, in years past, colonies died just the same, and I was surprised to find the mortality greatest in the hives that contained the most food. I decided that this was due to the fact that, when once these solid masses of honey became cold, the bees were unable to generate heat sufficient to rewarm them. Then with the appearance of a sunny day dozens of bees would leave the cluster and roam about over the surface of these combs. As night approached and the air became cooler these bees once more drew toward the cluster for warmth; but each time this would occur, numbers of stragglers would become isolated from the main cluster and collect together in the form of compact little knots on the surface of the outside combs, where they slowly chilled to death. In this way I found by actual observation that strong hives of bees positively dwindled down to a mere handful, and, with a sudden fall of the temperature, they would succumb. I was not prepared to cellar my bees, so I tried the tarred-paper plan and found it all right, except that there was too much labor and expense connected with it; so I started experimenting, with the result that I no longer lose any colonies here in my home yard from the rigor of winter, and it is pretty cool here too (17 degrees below zero last winter four nights in succession).

Here is just the plan I have hit upon, and the one I mean to follow until somebody shows me that I am wrong: Late in October, after all the honey-flow is past and Jack Frost has cut down all the flowers, I go into my yard armed with only a large pail and a long slender-bladed knife (the type generally known as a "physician's

knife" is best). I have the knife whetted to a razor edge. As it is late in the evening I experience no trouble from robbers, so I at once proceed to open the first hive I come to. This done I remove the frames in the center of the hive one by one, and, after shaking the bees off very close to the entrance of the hive, I place the comb firmly against some very solid object and begin by cutting down a circular piece of the honey  $1\frac{1}{4}$  inches in diameter, directly in the center of each comb, replacing each comb as soon as the hole has been made through it, and putting the circular chunks of honey in the pail. Having cut this opening through eight of the frames of honey and brood (always leaving the two outside ones intact) I close the hive and proceed to the next one.

The bees clustering in a hive are compelled to keep each frame of honey warmed to a certain point all of the time or there will be grave danger of the entire hive perishing, it being very similar to a person lying down to sleep upon a block of ice with another block over him. Once the honey becomes chilled through, most of the heat communicated from the bees passes back and forth over or under the frames, especially over them; consequently I think you will agree with me that a hole through each of the central frames is what is needed to remedy this, and concentrate the warmth of the hive.

Since adopting this method of preparing for winter I have not lost a single hive of bees. Two years ago I tried this plan at the home yard on eight hives that were not so well stocked with bees as they should have been, and, to my surprise, they came out in better condition than the ones that were stronger in bees in the fall. Last winter I tried the same plan with 35 colonies, with no loss whatever, and this winter I mean to prepare all the colonies in my home yard in this way, as I have full faith in its merits. However,

WILBUR WRIGHT IN ONE OF HIS FLIGHTS, SUCH AS HAVE RECENTLY TAKEN PLACE AT LE MANS, FRANCE, DURING THE PAST SUMMER.

WILBUR WRIGHT AS HE SAT DURING A FLIGHT IN HIS FLYING-MACHINE.

We copy the above pictures from a French paper entitled *La Vie au Grande Air*. The article was written by Wilbur Wright himself.

I would not advise any brother bee-keeper to try a large number of hives in this manner as a first experiment, as the locality might have something to do with the success of the plan. One of the very best features of all is the fact that hives treated as above will come out in the spring with at least three more frames of brood than hives at like period that did not have the holes through the frames. The bees always fill in all of these pop-holes before the close of the apple-bloom.

Sandusky, W. Va.

[The arrangement of having a hole through the center of the brood-combs has been used to a greater or less extent for a good many years. If we are correct, father Quinby away back in the 60's practiced it. The trouble is, it results in the mutilation of combs; and while, as you say, the bees will fill it up again at the next honey-flow, they are likely to put in drone comb. But with the ordinary Langstroth frame we question whether such holes are necessary, provided there be left a bee-space over the tops of the frames. It is the general practice now to use sealed covers, and this will leave a clear bee-space so the bees can go back and forth. If absorbing cushions are used it is the general practice to use corn-cobs, sticks, or what is known as the Hill device, over the center of the cluster. The purpose of these is to hold the cushion up, leaving a clustering space over the tops of the frames. The sealed cover with a bee-space, the Hill device, or its equivalent, will render such mutilation, in Langstroth frames at least, unnecessary.—ED.]

## GETTING COMBS BUILT SOLID TO THE BOTTOM-BAR.

### More About Splints for Staying Foundation.

BY DR. C. C. MILLER.

J. W. Kalfers sends some questions that he requests me to answer in *GLEANINGS*, which I proceed to do without repeating the questions.

I have had experience several years with several hundred divided bottom-bars. The chief advantage is that you can very quickly and easily have your foundation securely fastened to the bottom-bar and have an exact fit. But it is no better than to cut the foundation to an exact fit and wax it to a plain bottom-bar, if you are willing to take the trouble. Indeed, I doubt if it is quite so good. Bees are inclined to have a passage between the comb and the bottom-bar, and it's a little easier for them to gnaw such passage with the divided bottom-bar than where the foundation is waxed on a plain bottom-bar.

My bottom-bars are the same width as top and end bars—1½ inches. While this width has advantages, I'm a bit suspicious that bees are more averse to building comb down solid to it than to something narrower. Perhaps such wide bottom-bars seem to them like the floor of their dwelling, and they want the floor free to walk over.

Some of my combs are built solid to the frame, bottom, sides, and top, and are a comfort to look upon. But too many have more or less of the foundation gnawed away over bottom-bars, be-

cause given at a time when little or no gathering was going on. At such times bees have leisure to make a passage under combs, so as to make things as they, not you, think they ought to be. If rushed at taking care of the honey that is coming in, they haven't time to do any gnawing, and the comb is built down to the bottom-bar. So make sure to give frames to be built out at a time when honey is yielding if you want them built down to the bottom-bar.

When putting in foundation with splints, the foundation is not waxed to the end-bars. There is no trouble in getting the bees to build solid to end-bars if the foundation touches, or if it nearly touches, the end-bars. Indeed, I do no waxing at all, for the up-to-date kerf-and-wedge method of fastening to top-bar is used. Of course, waxing to the top-bar is just as good, but more troublesome. In no case would I wax to the end-bars; but I would have foundation securely fastened at top and bottom.

Even when divided bottom-bars are used, it might pay well to run melted wax along the bottom-bars to make it harder for the bees to gnaw a passageway.

New combs built on splints ought not to be more likely to break in the extractor than wired combs. If any difference, they ought to be less, for the splints are more rigid than wire.

To avoid the trouble of new combs breaking in the extractor, I know of no better way than to favor them a little until they begin to grow old. Put a heavy new comb into the extractor, and turn rather slowly until the honey from one side is perhaps half emptied. Reverse, and empty the second side. Reverse again, and complete emptying the first side. Of course, if you want to take the trouble, you can be still more careful, reversing more times, and emptying less at each reversing.

Marengo, Ill.

## BEE-KEEPING IN THE BRITISH ISLES.

### A Description of the Methods and Appliances Used.

BY JOSEPH TINSLEY.

Bee-keeping in the British Isles, which includes England, Scotland, Ireland, and Wales, is carried on under conditions far different from those in America, owing to the climatic conditions. I do not believe there is a single bee-keeper who depends entirely upon his bees for a livelihood; but many combine market-gardening, poultry-keeping, etc., with it. As an illustration showing the fickleness of the climate, take the past season. I am the recognized lecturer and expert in the county of Stafford for the Staffordshire Bee-keepers' Association; and in my trips to inspect hives and give advice I have seen many apiaries totally devastated on account of insufficient honey to keep them going in the months of June and July, which are generally considered our best months for the gathering of the nectar.

I should, first of all, explain that England is divided into 52 counties, or divisions, and in almost all of these divisions there is an association which is composed of a number of bee-keep-

ers. The average membership of the various societies I should roughly estimate at 300; but this will not adequately represent the bee-keepers, as many will not join, although it is to their interest to do so. Well, the advantages are many; but the chief one is to employ an expert to visit and inspect their hives free of cost, and in the winter months to take a lantern and lecture in the outlying districts and thus cause the spread of bee-keeping all through the county. The fee for membership is very little.

Now, where we are very much in front of America is in the way of holding exhibitions of honey, bees, and beeswax. Almost every county town has its annual flower show, and we endeavor to persuade the various committees to hold also a competition for honey, etc.

Needless to say, this is soon attended to, and the small show continues to grow each year. Our association then offers, for competition, silver and bronze medals, and thus greater interest

tural Hall, London, for a week at a time, and are visited by many thousands of people. All these methods tend to bring home to the British public the value of honey, and thus it is that the consumption of this article far exceeds its supply, with the result that a large quantity is imported each month from your country and others.

Accurately cut by machinery. A fine pin driven through each joint keeps the frame rigid. The top-bar has a saw-cut for fixing the foundation.

It should be noted that we have three bee-papers—the *British Bee Journal*, weekly; the *British Bee-keepers' Record*, and the *Irish Bee-keepers' Journal*, monthly. In addition to these papers almost every horticultural and agricultural newspaper issued devotes a small column to hints on bee-keeping, and, as a matter of fact, I contribute to several, giving work for the week, etc.

Now that I have described bee-keeping generally in our islands, I will explain the type of hive, appliances, and modes of working.

The hive most used is that known as the "W. B. C.," which is named after the inventor, Mr. William Broughton Carr, the present editor of the *British Bee Journal*.

It consists of separate inner and outer bodies, with a dead-air space all around of 1½ inches. At the bottom of the hive a set of small frames is arranged. This is to prevent swarming, as, instead of clustering, they will fill the bottom portion with honey, and then the bee-keeper can withdraw the box and replace it over the brood-nest, or on the top of the other supers. There is a sliding arrangement at the back; and to prevent the bees from sticking the body down, the bee-keepers put on a small coat of vaseline. It should

THE "W. B. C." HIVE.

is displayed. Then I attend the show, and with the bee-tent, which is composed of mosquito-netting to keep all the bees inside, I give a demonstration on handling live bees, explaining their habits, how to commence the subject, the value of honey as a food, etc. This is generally watched by a very large crowd, and many people take up the business. The exhibition also induces many to try honey for the first time, and people are also able to see the genuine article, and thus they are educated against any adulteration. The county of Stafford, by the way, is comprised of 744,984 acres, and the population is 1,236,919. Of course, some of the other counties are much smaller and the others larger. It should be mentioned that each association is affiliated to the parent body, viz., the British Bee-keepers' Association, which has its seat in London. Here examinations are conducted for the purpose of bee-keepers qualifying for experts. Honey exhibitions are arranged which are open to the whole of the British Isles. These are held in Agricul-

CHEAP RACK HOLDING 21 SECTIONS.

be mentioned that we have a standard hive and frame. The standard hive, as per illustration, consists of a body-box which holds ten frames, with accommodation for any quantity of surplus room over the top of this chamber. The bodies

are all made the same size, and one will fit the other. The size of the brood-frames is as follows: Top-bar, 17 inches; bottom-bar, 14½ inches; width of top, ¾ inch and 9 deep. These are fitted with adjusting metal ends.

Above the brood-nest, shallow bars or sections are placed. The shallow bar is nearly half the size of the deep bar; but in order to have a thicker comb for extracting purposes the number is reduced to 8 instead of 10. Each set of frames is fitted in the box, which we term a super. In regard to the section-racks, we have two styles—the ordinary rack, holding 21 sections 4¼ by 4¼ by 2, and the W. B. C. crate, which holds the same number, but they hang in a frame. The taller sections do not find such a sale here, and very few bee-keepers have adopted them, the greater demand being more for extracted honey than comb.

The entrance is narrowed to 2 inches. It should be mentioned that the hive-entrances are sunk into the wood, and just allow sufficient space for the bees. No mice can enter, so we

RAPID SPRING FEEDER.

English bee-keepers have no real winter enemies. The bees are fed up about the end of September, and no more attention is paid until the middle of March. By this time the bees have generally consumed all or nearly all of their winter stores; and the bee-keeper, after making an examination on this point, commences to feed them gradually with syrup made from a recipe similar to the one given above, and a small quantity is given to the bees each evening.

This has a stimulating influence on the queen. The amount of syrup is gauged just so that it is sufficient for the bees' requirements, and does not enable them to store any; consequently the queen lays at an enormous rate, and about the middle of April another set of deep combs (10) is given over this brood-nest for the queen to continue her laying. We call this "doubling." Now she has 20 combs to continue her laying, and in another three weeks' time the whole lot will be alive with eggs, larvæ, and pupæ in all stages. The honey-flow commences about the middle of June, and lasts only during portions of the months of June, July, and August, so that, when the flow does arrive, we have the hive

teeming with bees. To give an idea of this, our comb averages on both sides about 5000 cells, so that in the 20 combs you have available space for

CANADIAN FEEDER.

100,000 eggs; and, taking off one-tenth for pollen, waste cells, etc., you can thus get an idea of the breeding-ground of the queen. When the flow arrives we often as not have a working force of 80,000 to 120,000. As soon as the honey comes in, the queen is placed in the bottom box, the hatching brood placed in the top, the unsealed larvæ in the bottom, and two or three extra supers given to the colony. The top box, which the brood is still in, is also used as a super as the bees hatch out. Thus Her Majesty is, to a great extent, prevented from egg-laying, and using honey at an important time, because you must take into consideration that every pound of larvæ means many pounds of honey, and you can get larvæ produced by sugar-feeding

at 2 pence per lb., while the honey would sell at 7 or 8 pence.

Another method is to put two colonies together by making a nucleus of the queen and one bar

of brood. This process gives excellent results, and the little stock will work into a good one by the end of the year. The harvesting and extracting of the honey is done very much as you do it in your country; but of course the quantity per hive is considerably smaller, and a little extractor called the Guinea is the favorite here.

We have three main crops of honey; viz., fruit-blossoms in the spring; white Dutch clover and sainfoin in the summer, and heather in the autumn. The former produces a dark strong-flavored mixture, while the clover produces a flavor and color similar to the sweet clover of America. The heather is the most prized, and seldom if ever

to take her course and supersede as required. There are, of course, a few scientific queen-raisers, but nothing as in your country. In the au-

Manner of working two or more queens on the tiering plan, either with one or four entrances. From 1893 edition of *Modern Bee Farm*.

does the price exceed 25 cents per pound. It has a reddish color, and is of a jelly nature. It being impossible to extract the nectar by the aid of an extractor, the combs have to be completely smashed up and the whole lot placed in a press and the juice squeezed out. Very rarely, however, is much of this honey gathered, as the weather is generally unfavorable when the plant is in bloom.

The working of the hive must necessarily be confined to the four seasons. The bees are, of course, wintered on their summer stands, and, with plenty of overhead packing, consisting of carpets, sugar-bags, papers, etc., and with 30 lbs. of honey, they are safely housed against the storms. If the colony has not sufficient of its own honey, then it is fed up to this amount with sugar syrup made as follows: White lump sugar, 10 lbs.; water, 5 pints;  $\frac{1}{4}$  oz. salt;  $\frac{1}{2}$  oz. vinegar, and a teaspoonful of naphthol beta. The latter is for foul brood. The whole mass is thoroughly boiled, and fed to the bees in a Canadian feeder over the tops of the frames.

Queen-raising is not practiced to a great extent in England, many believing in allowing Nature

Double two-story stock hive with Wells' perforated divider between. From 1893 edition *Modern Bee Farm*.

tumn many people send wagonloads of hives to the heaths and commons for the heather harvest, and excursions are planned by associations to have a day among them, when useful information is imparted by the experts. The railway companies also have a special rate for the conveyance of such traffic. What we lack is more favorable climatic conditions; and if we had weather similar to yours we could, I have no doubt, hold the first place in the world in the art of bee-keeping.

I should mention, with regard to the dual system, which some of your bee-keepers are advocating, that we practiced that years ago but discarded it. We called it the Wells system, but, of course, the queens were kept apart by means of a perforated dummy.

Queen-excluder, fitted in frame, shown under super crate common to both sides. From 1893 edition *Modern Bee Farm*.

#### UNITING WITH SWEETENED WATER.

In uniting two hives of bees did you ever try soaking them with a spray of sweetened water till they were all dosed in good shape?

H. J. WITHERELL.

Glenmary, North Falmouth, Mass.

[This is an old and very common practice. It is no better than a little smoke, and not so convenient. See editorial on uniting, Oct. 1, page 1178.—ED.]

# HEADS OF GRAIN

## FROM DIFFERENT FIELDS

### A SWARM THAT LEFT THE PARENT COLONY HOPELESSLY QUEENLESS; THE ALFALFA-BLOOM LOUSE.

In Stray Straws, August 15, Dr. Miller questions whether a swarm will leave the parent hive hopelessly queenless, and in a footnote you ask for more evidence on the subject. I had the exception which proves the rule occur in my yard about three years ago. The colony was a strong one, and on finding them queenless, hopelessly so, I gave them a ripe cell from my breeding-queen. This cell hatched all right; and later, when the swarm issued with her, and clustered in an oak-tree, I went on with my work in the yard, being sure they would return to the hive. Imagine my surprise and chagrin to see them, when they broke cluster, depart for the woods.

Recently I noted in GLEANINGS a reference to the damage to alfalfa, or, rather, to the honey-yields from it, by what was termed the alfalfa-bloom louse, and I am wondering if it can be the same insect that seems to be playing the mischief with nectar secretion in the palmetto and other bloom here. This is a very small, brownish-colored louse, which appears in the newly opened bloom, and not only saps the nectar as fast as it forms, but also blights or prematurely dries up the blossoms. It is owing to this pest, I believe, that we have had no really good flows from either saw or cabbage palmetto for the past four or five years.

C. S. HARRIS.

Holly Hill, Fla.

### NO DANGER OF BREAKAGE IF STRAW IS USED UNDER CRATES IN WAGON.

Tell Mr. Johnson, page 1139, Sept. 15, that by placing three or four inches of straw under the honey it can be safely hauled on a lumber-wagon. The straw should be three or four inches thick when the full load is on it. I have had lots of experience, and have never lost a section of honey.

I. C. BACHTEL.

Cedarville, Cal.

[Straw is cheap, available, and an excellent cushion in the bottom of crates holding shipping-cases, in wagon and car bottoms. It is used very largely in all these places; but its use should be more general yet. The following plan is a good one.—ED.]

### HAULING COMB HONEY SUCCESSFULLY ON A SPRINGLESS WAGON.

On page 1139, Sept. 15, Mr. John H. Johnson asks if comb honey can be hauled safely on a lumber-wagon without springs. Yes, it can if it is crated right. We have shipped thousands of pounds of comb honey to different points, such as Richmond, Va.; Washington, D. C.; Huntington, W. Va.; Ashland, Ky.; Coal Grove, Ohio, and all our adjoining counties, and other places too numerous to mention, and we have never yet heard of a case getting mashed or broken.

Here is the way we pack the honey for shipment. It is first put in the regular 24-lb. ship-

ping-cases, and packed one, two, three, or four cases, according to the size of boxes used. If one has no drygoods-boxes, as many as necessary should be made, each box two or three inches larger on the inside, and three or four inches higher than the cases, to make room for packing material. A box to hold four cases, two tiers high, should be 20 inches wide, 29 long, and 14 high. Pack all around and under the bottom cases with hay, straw, shredded cornhusks, or excelsior—all are good. Have a slatted cover for the box, and strips nailed on ends for handholes. Mark the box-cover "Comb Honey—Handle with Care." Name and address, and it will go safely anywhere on almost any kind of road. I would not advise putting more than four cases (96 lbs.) in one box, and the boxes should never be more than two cases high.

We live 35 miles or more from any railroad, and every thing has to be hauled in or out on wagons, and none of them have springs. We send honey on them to the depot to be sent by express or freight to consumers at different places, and we have always received encouraging reports. Our roads—well, I don't think they could be much worse anywhere, for this is a rough, rocky, and mountainous country.

Grundy, Va.

W. J. D. BOOTHE.

[The plan heresproken of excellent. The straw forms a cushion on all sides.—ED.]

### A WINDBREAK FOR SINGLE-WALLED HIVES.

In the last 15 years I have found what I call a windbreak absolutely necessary with single-walled hives, especially in the spring.

The affair is simply a thick piece of wood. The lower edge is beveled, and is provided with slots about 5 inches apart, and cut diagonally across the edge at an angle of 45 degrees. The idea is to direct the air to either side of the entrance rather than straight toward it.

Saltsburg, Pa.

G. W. MARTIN.

### A PIT FOR WINTERING BEES.

A year ago I wintered 14 colonies of bees in a pit, and lost only one. The entrance to that one got clogged with dead bees, and they smothered.

I don't know how many colonies were in the cellar; but I did not have as good success with them. Last winter I put 22 colonies in the pit, and all came through finely, and were so strong that I put supers on all of them at the commencement of apple-bloom.

Here is a puzzler to me: One colony that was on the bottom of the pit got the entrance completely covered with dry dirt that got in through a hole in covering them. When I saw them I said to my helper, "Here is a dead one," and I set them down and jerked the cover off. Imagine my surprise. They were alive and all right. I had 79 more colonies in a dry cellar—one that I would call an ideal cellar; but I have lost six, although some of them wintered finely. I intend to put all my colonies in the pit next winter.

F. W. WALRATH.

Waterloo, Ia.

[Beginners should be cautioned about attempting to winter bees in a pit unless they have a sandy soil or provide good drainage in case of a clay soil. What is more, they should not try the experiment on too large a scale. Pit wintering depends on a good many conditions; and one will have to determine whether the plan is feasible or not for the locality by first testing it on a small scale.—Ed.]

#### IMPROVING A LOCALITY.

I live in an open pine-woods country, and bees scarcely ever make more than they need for winter use. Could you name some honey plants or trees that would thrive in this climate and soil that I could plant and cultivate so that my bees could get a sufficient amount of nectar so that I could get honey for home consumption?

Simpson, La.

ELIJAH WILLIAMSON.

[You would be safe in trying sweet clover in your locality. It does not need cultivation at all, and in time will improve the soil for other crops. It grows very luxuriantly in Louisiana, more especially in the sugar-cane fields. Both in Mississippi and Louisiana it is a valuable forage-crop. Alfalfa grows well in your State. Alfalfa, or pin clover, will probably grow well in your section. You can possibly secure some seed from Arizona of the last-mentioned plant. Buffalo clover is worth trying, as it grows in Texas. If we knew what sort of soil and climate you have we could advise more intelligently.—W. K. M.]

#### A FURTHER SUGGESTION IN REGARD TO A HIVE-CONVEYOR.

On page 1119, Sept. 15, Mr. F. G. Marbach's idea of a hive-lifter and conveyor looks pretty good. But wouldn't it be better, instead of using only two posts and a wire cable, to make a track of 2×4 or 2×6 lumber, and have it supported by posts, say every 8 or 10 feet, by means of cross-arms extending 20 or 24 inches from the posts, to give room for a load of supers or hives to pass the posts? Then a traveler similar to a barn-door hanger could be used to run on this track with a tackle or other hive-lifting device attached to it. This would have the advantage over the cable in being more rigid, and could be continued to an indefinite length. It could be

run right to the door of the honey-house, so that no wheelbarrow or cart would be needed. If it were necessary to cross a road or driveway a section or two could be made removable, so when not in use it could be taken down out of the way.

Blanket, Texas.

[A. A. ASHLEY.

[Your plan is perfectly feasible, and perhaps better, but more expensive. It would have the advantage that the track could be curved, and this might be very important in some cases.—Ed.]

#### PROPOLIS FROM WAX.

A few years ago I had a cake of bright-yellow wax lying out in the yard under some shade-trees. One day I noticed some bees on this wax. I watched them a while, and found that they were gnawing on the wax and putting it in their pollen-baskets. As nearly as I could tell there were only six of them. I looked over the hives in the yard, and found that those bees were daubing up a crack between the cover and hive-body on a certain hive; and, as nearly as I could tell, those few bees were the only ones working on this cake of wax. I watched them perhaps half an hour, and saw that, during their manipulation of the wax, it got darker, and almost resembled, according to my eye, the propolis on the hive in other places. Some time after that, having occasion to open this hive, I noticed that the wax those bees deposited was the genuine stuff called propolis, in color, stickiness, and smell; and ever since that time my belief has been that propolis is manufactured by the bees out of wax mixed with some substance to change it chemically. That the bees never gather any substance to use as propolis I will not claim. During the summer and fall the mesquite exudes great quantities of a gum we call mesquite wax. We gather it and dissolve it, and make a very fine glue. Now, I ask you, why do not the bees gather this glue? I have never seen any bees, nor have I ever heard of any one else seeing a bee, working on this gum. If our chemists hunt for it they may find what the bee deposits and mixes with the wax to cause that change.

J. A. RUFF.

Fort McKavett, Tex.

#### VERTICAL WIRES AND HALF-INCH-WIDE STARTERS.

Will you please state the objections to wiring frames perpendicularly by driving the right length of staples into top and bottom bars and imbedding half-inch strips of foundation on to the wires? The objections to wiring, unless you use full sheets of foundation (which I consider too expensive), are that the bees often fail to get the wire in the septum. This makes depressions in combs, with the wires in sight. Now, if this is an old idea will you please state the objection? I don't see why it would not be a big improvement over all other methods of securing straight combs.

G. E. PHILBROOK.

Lakeside, Cal.

[This plan of wiring is one that has been and is used to a considerable extent. It takes a lot of time to prepare a set of frames in this way, however. We don't quite understand whether your narrow strips of foundation are to run vertically or horizontally. The former would hardly give satisfaction.—Ed.]

# OUR HOMES

By A. I. ROOT

Gather up the fragments that remain, that nothing be lost.—  
JOHN 6:12.

In *Our Homes* for October 1 I spoke about the importance of having a place for putting our money where it will be safe, and right at hand when needed. So many kind words have come for that *Home* paper that I am convinced of the great need of a postal savings bank; and I wish to say something in this present *Home* Paper about teaching the children the importance of saving their pennies instead of being continually looking out for some way to get rid of them as fast as they are earned. But before going into this I wish to discuss a little the way in which the average child is in the habit of investing his earnings.

In all of our towns and cities—yes, and even in our country stores—there are a good many attractive things to catch the children's nickels, and not only the nickels, but even the pennies. Now, so far as toys and playthings are concerned I have nothing in particular to say against them. Very likely some children, especially where there is but one child in the family, have too many playthings. This one child does not value them, because, before he has exhausted or got tired of any one plaything, he gets another. What I wish to refer to especially here is encouraging a child to waste his pennies (or worse than waste them), in buying things to eat when he is not hungry; and not only that, encouraging him to be constantly eating between meals. T. B. Terry's vigorous teachings are beginning to wake up a good many people. Hundreds if not thousands are finding a great improvement in their health by taking no food of any kind except at the regular mealtime. Confectioners are continually planning and studying up something new to catch the pennies. A while ago it was a ball of candy on the end of a stick. Every child had to have one. The manufacture of chewing-gum has become so great a business that quite a number of gum-makers are millionaires. If the gum contained nothing but what exudes from the spruce-trees, such as may be gathered in the pinery woods, it would not be particularly objectionable, perhaps. In fact, I have heard that chewing gum is an excellent means of cleaning the teeth. But when we find combined with the gum variously flavored candies to tempt the taste and appetite, it becomes, I am sure, a serious meance to health. Ice cream used to be 10 to 15 cents. It is now offered on the fairgrounds for a nickel in little cones; and in various cities it is hawked about the streets in penny packages. And not only ice-cream but various ices. In Havana, Cuba, I used to be quite fond of pineapple ices and banana ices for only a penny. I bought them for curiosity; but when I found they used spoiled pineapples and bananas to make penny ices I cut off that sort of investment. I think that some of the stuff made me sick before I inquired into it. Who can tell how much money is invested at ice-cream and soda fountains? I have not bought any myself for years, because I found out years ago that it did not agree with me. But I often stand near

these fountains on a hot day and look at the string of customers, old and young, that sometimes crowd around the vender, and often have to wait their turn. I often see boys and girls who work at our establishment, and who get only small pay, throwing away their nickels at these soda-fountains. Perhaps some of you may say that if we get rid of the saloons we ought to be satisfied without commencing to criticise the use of ice-cream, soda, and soft drinks in general. Some of you may also urge that physicians tell us growing children *need* sugar—that they have a natural craving for it. Granting all this, I am sure it will be better for the child as well as for the adult to get the sugar that is needed when he has his regular meals, and in a shape where it will not cost any thing near the amount of money that it does to buy it of the confectioners and druggists. I feel certain the long list of diseases that afflict our people at the present day are caused largely by using more sugar than we need, and especially taking it between meals, instead of at the regular appointed time. If I should suggest that *honey* is the most wholesome sweet that can be used you would think I am prejudiced because this is a bee-journal. You know, if you remember, that I am starting out to live a *hundred* years. I am not really sure I shall be able to write for *GLEANINGS* when I get to be 95, but I will try to do so if God lets me live so long. Well, one aid to our living to a good old age is to be by cutting off cane sugar. I have not eaten a spoonful of sugar in a year, and very little for several years. I have lost my taste for it. It makes my food unpleasant to have it sweetened. Mrs. Root makes two kinds of apple-sauce—one with a little sugar in it, and the other with none at all; and so with other kinds of fruit. The sugar does not agree with me. But the sugar in sweet fruits of any sort does not seem to disagree with me at all. Last night I must have eaten toward a dozen *Paradise* sweet apples. They were not very large, on account of the dry weather. Now, I suppose so many sweet apples just before going to bed would make most people sick—I think mainly because they are not in the habit of eating apples every day as I do. To tell the truth, I ate more than usual last evening just because I wanted to demonstrate how nicely sweet apples agree with my digestion. I felt better than usual, if any thing. There was no bad taste in my mouth in the morning, and I felt unusually well all the forenoon.

Now, dear friends, I have mentioned all this to try to convince you that it is not only wasting money but it is not conducive to health to use candies, ice-creams, etc., and drinks, especially between meals. I use lemonade quite freely, and I greatly enjoy it, but always without any sugar.

Now, with all this preface I wish to tell you something the W. C. T. U. has recently started in the way of encouraging children to save their money, and at the same time save their health. My sister, Mrs. E. J. Gray, of this place, has all her life been connected with the work of the W. C. T. U.; and in regard to this new phase of her work she writes the following:

## DOMESTIC DISCORDS.

A very prolific source of domestic trouble is the use of the family pocketbook. If the young wife has not had discipline and

training in the use of money she is likely to imagine that a reasonable weekly allowance will buy almost every thing; and before the week is half gone she will find her funds exhausted and be obliged to ask for more or go in debt, hoping that the next installment will help her out. After getting hopelessly in debt the husband loses confidence in her ability to use money, and so decides to take things in his own hands, doling out twenty-five or fifty cents to her when she asks for it. Or, on the other hand, if the man himself is improvident, using this joint means for cigars and other unnecessary things while the absolute necessities of the family are not provided for, a spirit of contention arises, and, not infrequently, it results in a case in the divorce court. The great lack in both of these cases is in early training in economy and thrift. The system of school savings banks is an ingenious method of instilling into a child's mind correct ideas of the value of money. The exercise of calling the roll Monday morning and receiving the pennies and nickels stimulates the whole school to learn ideas of thrift and economy. Habits of self-denial, and controlling the appetite, are thus formed that will go with children through life. Abundance of testimonials might be given where this work has been in successful operation. It should be introduced in all our public schools, particularly in the primary and intermediate departments.

So many devices are now used to induce children to spend their pennies that there is need of special training. The latest device we have noticed is a slot machine with a glass case containing salted peanuts. A penny in the slot will bring a small handful of peanuts. But a little white bead is mixed with the nuts; and if you are so fortunate as to get a bead with the nuts you can go inside and get five cents' worth of candy by producing the bead. A group of children were eagerly trying their fortune. Not only spendthrifts but gamblers were thus being trained.

For further information regarding the system of school savings banks, send to Mrs. S. L. Oberholser, 3509 North 22d St., Philadelphia, Pa., National and World's Superintendent of this department for the Woman's Christian Temperance Union, or to Mrs. E. J. Gray, Medina, State Superintendent for Ohio.

She has also handed me quite a string of testimonials from different public schools in regard to how the school savings bank is working. I have room for only one of them.

About two years ago I gave you quite an interesting story in these pages in regard to the way in which Mrs. Florence Richards, of Leipsic, O., made their town dry. It was the story of how she, a woman, almost alone, succeeded in getting rid of the saloons in her town. This good woman sends the following report in regard to their own school:

Mrs. Florence Richards, in writing of the system in the Leipsic (Ohio) public schools, says: "The system has worked a revolution in our schools, and our teachers say the scholars are more easily governed, more studious, and that the whole moral tone of the school has been heightened. Our homes have felt its salutary effect. We are having our house painted, and the painter said to me to-day: 'My boys are starting bank accounts, and it is wonderful, since they began, how little gum and candy we have had around the house. One of the boys said to me, as he started to school last Monday with his pennies for deposit, 'Papa, if we can get along without our gum and candy, couldn't you get along without your tobacco?' and I said, 'Yes, and I will.' I have for the last ten days put my tobacco money in a box, and I have saved \$2.50 in that time.'"

In another column I have talked to the boys about saving their pennies to buy copper wire and batteries. I can well remember the time when the newsboy Edison began to startle the world with his wonderful experiments. He had had but very little money, and he needed it so badly for chemical apparatus that not a copper was wasted. I have been watching him ever since boyhood (for he lived not far from Medina) much as I have been watching the Wright Brothers in their experiments. At one time Edison happened to be in a strange city, out of a job. He went into a telegraph office and asked them if they could not give him some kind of work. He was plainly clothed, and this, together with his boyish manners, made some of the city clerks think he would be a good victim for a joke. They were just at that time in need of one of the best experts—a man who could handle twice the amount of business than any ordinary operator

could. They told Edison that he might sit down to the instrument and see what he could do with it. Then they piled the business on to him faster than any living man, as they supposed, could handle it. When our young scientist caught a glimpse of what was coming he put his hand in his vest pocket. Was it for a piece of tobacco, think you? Not any tobacco for young Edison. He pulled out a piece of *spruce gum*. I suppose he had gotten into the habit of chewing gum; but it was the genuine, right from the spruce-tree, and it was not sugar-coated or flavored. These fellows who put the job on him soon found the "joke" was on themselves instead. This green-looking boy could do the work of any two men that had ever been in their office. Electricity, and especially telegraphy, at that time was his great passion. He was the boy who saved his pennies; and not only that, he saved his precious moments. The world was so full of wonders, especially those that spread themselves out before his eager gaze, that he scarcely took time to sleep. Not an hour ago I picked up a paper that stated he is probably worth at the present time 25 millions of dollars. He has a home at Fort Myers, Fla., not far from our home at Bradentown. The paper further stated that he says he is now going to quit work—that is, he is going to quit working for any thing except "just for the fun of it." One of his latest schemes is to make houses of cement; and when he gets his plans perfected he expects to make an entire house, ready to live in, in about three days, and a better and more durable one than the world has yet seen.

Now, friends, if this new project started by the W. C. T. U. is going to encourage our school-children in starting a bank account instead of wasting their pennies and injuring their health, I think it may prove to be a God-send to the children of the new year now before us—1909.

By way of explanation I clip the following from one of the printed circulars:

A deposit list, copied from the teacher's roll-book, must be sent monthly to the bank in order that the accounts of the scholars may be individualized.

When a child has deposited \$1.00 he is given a bank-book, and becomes, through the school, a regular patron of the savings bank. When the deposit reaches \$2.00 or \$5.00 (as the bank may elect), it draws interest at 3 per cent or more.

The pupils are allowed to take their bank-books home for a day or two at the close of every month. The family interest aroused by the monthly examination of these bank accounts has in many instances, already noted, had telling effect, and older folks have learned lessons in thrift through their children.

Deposits will be received every Monday only, at the morning session, by the teachers of each school. The amount will be delivered to the principal, who will deposit it in the ——— Savings Bank in the name of each depositor.

One cent or upward can be received by the teacher. When a pupil has a deposit of \$1.00 or more, a bank-book will be given, free of charge, from the bank.

---

#### THE WRIGHT BROTHERS AND THEIR FLYING MACHINE UP TO DATE.

A few days ago a prospectus of the *Scientific American* was placed on my desk; and in enumerating the many things that journal has done for the world I was surprised to see the broad claim made that theirs was the *first* publication to announce that the Wright flying-machine was a success. This statement vexed me a little because of the fact that GLEANINGS IN BEE CULTURE announced it to the world a long while before the

*Scientific American* had taken any notice of this wonderful invention. In our issue for March 1, as far back as 1904, p. 241, I gave the first intimation of what was going on here in Ohio in the way of flying; and at frequent intervals during 1904 I visited the Wright Brothers at Dayton, Ohio, to witness their preliminary experiments. In our issue for January 1, 1905, I gave the result in detail, occupying three or four pages of GLEANINGS. Just as soon as an impression was off the press I mailed a copy of it to the *Scientific American*, and sent a letter accompanying it, thinking they would, of course, be glad to give it a wider publicity than we could give in our comparatively little journal. Well, what do you suppose happened? Not a peep, not a word of thanks for the trouble I had taken to give them full particulars of what I had been an eye-witness. Do you suggest that perhaps they did not get my letter with the proof-sheets? They *did* get it, and promptly asked me for *another* copy of our journal. Not a word of thanks then, and no mention of the Wright Brothers until more than a year afterward. If they have any thing to say in defense of their way of announcing inventions as they come up, we shall be glad to be corrected. In our issue for Jan. 15 I gave some further particulars with a cut of the gliding machine. At that stage of proceedings the Wright Brothers would not permit a photo of the complete apparatus to be given in print, for they had not fully secured their patents.

On page 48, Jan. 1, 1905, I gave my reasons for having kept back some news of this wonderful discovery as long as I did. Permit me to mention here that as soon as I had *permission* to give my write-up of the machine I sent the Wright Brothers a check for \$100; and, in fact, I would have been willing to send \$500 for the privilege of announcing to the world this wonderful invention. They thanked me for the check, but it was promptly returned, thus indicating that those two young men were not working altogether for the almighty dollar, but, rather, that they may benefit humanity.

While I am about it, permit me to say I am also a little surprised to see in the *Technical World* for November the following statement:

In June, 1906, the *Technical World Magazine* announced the success of the Wright Brothers, of Dayton, O., in the private tests of their wonderful aeroplane. The *Technical World Magazine* was the first publication to accord full credence to the Wright Brothers' claims, now so abundantly made good.

And the *Technical World* admits they did not give it to the world till 1906, while GLEANINGS goes back to March, 1904, with frequent mentions of what the boys accomplished step by step until the present.

At the time I gave my write-up there were several points in regard to the machine that I was not permitted to mention; but since these various features are now being fully discussed through the various periodicals I presume I am at liberty to tell what I know about it.

The first was an apparatus for putting a stronger curve on the tips of the wings when rounding a curve. Second, a device that would enable the machine to spring up into the air as a bird does in starting. When I first visited them they were obliged to run the machine along a single rail for, I think, 60 or 70 feet, in order to get up suf-

ficient speed to "climb into the air." This long track had to be moved so as to face the wind every time the wind changed, making considerable labor for each successive experiment. I suggested wheeling the machine up on to a platform over the little building where it was stored, so as to get up momentum by running down hill. After I left them I figured out in my mind that a derrick from which a weight could be dropped something like a pile-driver in order to get up a good momentum in starting would be a good plan. I was so full of this idea that I made a second trip in a short time, and was astonished as well as pleased to find they had got hold of the same thing and had it in practical operation. They had a lot of iron weights, about the size of a small grindstone, with a rope running up through the hole in the middle. By hitching on more or less iron weights they could get up any desired speed. I think they used fully as much as 1500 lbs. for the experiment at Dayton. This weight dropped 15 to 18 feet, and by a system of pulleys to magnify the *speed* and *distance*, the machine was given a sudden impetus that threw it up into the air a sufficient height and with sufficient speed to start the vehicle for flight. The device was a complete success from the start.\* I think the great wide world has had no intimation of this starting-device until the present summer. As I see pictures of it in the various magazines just now I suppose I am at liberty to describe it as I have done above.

I have from the start, perhaps, been more sanguine in regard to the value of their invention than even the Wright Brothers themselves. I may have forgotten; but if I am correct I think it took only little if any more gasoline to go a mile with the flying-machine than it does to run my automobile that distance; and this wonderful advance and achievement over all other methods of locomotion is that they are without any expense for tracks, macadam roads, or bridges. Right in sight of the bicycle-factory where these two men made their flying-machine is a bridge that cost, if I am correct, half a million of dollars. What will it be worth to the world to be able to go in *any* direction and any distance, *independently* of bridges? What do you suppose all the bridges in this world have cost, to make no mention of roadways and railway tracks and gradings?

In our last issue I said I hoped that Wilbur Wright would not be persuaded, *just now*, to attempt to cross the Channel or any other large body of water. I notice by a clipping from the *Cleveland Plain Dealer* of Oct. 19 that my good friend Orville backs me up in what I have said. See this:

ORVILLE WRIGHT SAYS HE WOULD ATTEMPT NO FLIGHT OVER ANY HIGH OBSTACLES.

The idea of flying over cities in a machine like the one with which he made his successful flights at Fort Meyer does not appeal to Orville Wright. He would not be willing to undertake a trip of that kind. The work he did at Fort Meyer was as hazardous as he is willing to perform.

The doctors attending the aviator are permitting him to see visitors, and the expression of opinion here set down is the first utterance from him by way of criticising the hopes of aerial navigation created by the work done in Paris and Washington.

He is afraid to trust any motor he has ever built or seen to the performance of such a task as has been suggested by the optimists who have expressed the opinion that Wilbur Wright should accept the challenge to cross the English Channel in his machine

\*It really reminds one of firing a man into the air out of a cannon when the trigger is pulled to let that big weight drop.

and continue across the country over cities and other obstacles requiring the aviator to go high into the air. The unreliability of the motor is what he fears.

Please notice in the above, he only says he will not just *now* "trust any motor he has ever built or seen;" or, in other words, at the present stage of proceedings it would be exceedingly unwise to fly over any but the most favorable territory on account of the possibility of accidents. Should any thing happen to the motor, we have found by repeated tests that a safe landing has usually been made over any farming territory; and a machine will alight easily and safely on any sort of farm crops without much risk of harm, with the stout runners I have described, gliding along on the surface of the ground without much risk of damage to the machine.

Of course, many more experiments will have to be made while the machine goes through an evolution something similar to that of the automobile.

I noticed this morning the statement made in the morning papers that Wilbur Wright said a flying-machine need not cost more than \$300 when a considerable number of them are made at a time with adequate machinery. I think *we* could easily make such a machine for less than \$100, aside from the cost of the engine, provided fifty or a hundred are built at a time. Whoever owns the patent, will, as a matter of course, need a pretty good profit in order to recompense him for what he has invested in the patent, and also for the investment in the necessary factory and equipment for building flying-machines.

#### SOMETHING ABOUT ELECTRICITY AND THE PROGRESS IT HAS MADE IN THE LAST FIFTY YEARS.

Just a few days ago my life was brightened by meeting an old schoolmate whom I had not seen for toward fifty years. When we were boys a dozen years old we were both greatly taken up with chemistry and electricity. A kind teacher gave me a book entitled "Conversations on Chemistry," and my schoolmate, Corwin Purdy, got out of some old garret a book called "Comstock's Chemistry;" and didn't we two boys have fun with our chemicals! We made gunpowder and fulminating powder, and finally hydrogen gas with which we filled soap bubbles, but they went up so rapidly that we hardly had a chance to touch a match to them. Finally we mixed common air with the gas so as to make an explosive, and this, also, made them go enough slower so we could catch them with a lighted match. When he made a new discovery he would run across the valley over to our house on the hill and tell me to "come quick" and see his new invention. In the same way I used to run for him to come over to our house. When we got on to electricity the matter was rather deep for us. The science was then in its infancy. I made a galvanic battery; but it did not work—that is, it did not produce an electric shock as I expected it would. He tried it on another plan, making a "galvanic pile" of sheets of zinc, copper, and cloth. The cloth was moistened with a weak acid; and, oh how delighted we were when it not only gave a faint shock, but produced sparks that were plainly visible after dark! When I went home I wound some copper wire around a little

rod of iron and hitched my wires to my battery; and, lo and behold! it *did* work. The iron picked up nails and let them drop; and after I had spent all of my hoarded pennies for wire I made a little telegraph apparatus.

When I was about fourteen, however, my father moved away from Mogadore, Summit Co., Ohio, and I lost sight of my friend Corwin. When I came to Medina I kept on with my electrical experiments, and soon had a revolving magnet exactly on the principle of the electric motors of to-day. I also succeeded in exploding hydrogen gas with electricity, thus rudely outlining the gas-engines that run automobiles at the present time. When I got my little electric motor so it would run a miniature home-made sawmill I started out "giving lectures" around at country schoolhouses; and my old friend W. P. Root, who is taking down these notes for me, remembers coming, with his father and older brothers, to one of my lectures at Sharon Center, Medina Co. I think that, in that boyish lecture, I predicted that electricity would some time supersede steam as a motive power for travel. I do not know but I told them that steam might be superseded in four or five years. My only mistake was in not multiplying my figures by ten, and saying *forty or fifty years*. Yes, it may take another fifty years yet, to fulfill fully my prediction. At that time of my life I was reading the *Scientific American*, and ransacking the world as well as I could for all the books on electricity. It was not very difficult, as there were only a few at that time.

Now, what prompted this paper was the sight of my old friend Purdy, transformed from a black-eyed, black-haired youngster to a white-haired and white-bearded man of almost seventy. Friend Purdy is still not only alive, but on the alert to know the new things that God is revealing to us through chemistry and electricity. Fifty years ago a galvanic battery, to do any sort of work, even in the way of experiments, cost four or five dollars, and it would run for only a few hours, and then the zinc plates had to be washed off and a new solution prepared. Now we have batteries of considerable strength that cost us only a few cents, and yet they will not only run for months but even for years. The electric clock in our bedroom has been running by batteries that are now over a year old, and I do not know how much longer they will last. After using a set of batteries in my automobile for several months until they were so far run down that they did not give good service, I found one of the exhausted cells would still ring a little doorbell very well; and just to test it I left the bell ringing in my automobile-house. I think that, after it had been running for two days, and was still making a faint jingle, somebody who slept upstairs in our house several rods away was found poking around in my automobile-house. When I came up to question the intruder he said he was trying to see if he could not stop that "everlasting clatter" that kept them awake nights; and I believe this run-down battery kept that little doorbell going for something like *three* whole days and nights.

By the way, in our last issue I spoke about battery-testers; and one of these cheap doorbells makes a very good battery-tester except that it is

almost too large to put in your vest pocket like the one we advertise. Fifty years ago a U-shaped electrical magnet covered with insulated copper wire cost about \$2.50; but now you can get a much neater one from dealers in electrical supplies for two dimes and a half; and a dry battery to run it costs another two dimes and a half or even less. Insulated copper wire, a few yards of which took all the pennies I could scrape to buy, is now kicked about under foot wherever electrical people are working. I always scold, however, to find it around our premises, because the sight of it reminds me of how badly I wanted just a little in my boyhood days, and yet could not afford to buy it. Even away down in Florida, after the men did the wiring on our cottage for the electric lighting, they threw the remnants out in the doorway. Of course, when they sent in their bill they charged me for this useless wire that they threw away; and every time I see one of these little dry batteries, that can now be had for fifteen or twenty cents, I am lost in wonder to think of the energy that is stored up in that little metallic can, and which will be given out at the bid of man to do important work, not only announcing that somebody wants to see or talk with you, but to carry your message miles away, or light the gas to push your automobile, when there is an emergency call that demands your presence somewhere, at the rate of almost a mile a minute. It is the developments of chemistry that have given us this wonderful power. The fables in the Arabian Nights that Corwin and I used to read and laugh over have come to pass; but *truth is greater* than fiction. The author of the Arabian Nights thought he was telling a tremendous yarn. But he did not make his yarn big enough. He did not know what was coming fifty years ahead.

And now I hope, dear friends, that there may be other boys (or may be *girls*) who are as crazy as Corwin and I were in olden times to know more about the wonders of chemistry and electricity. Such a boy is more likely to be found in a home where there is not much money; and I want to whisper to him to gather up those scraps of copper wire that men throw away, and then go around to the automobile-shops and ask for some of the discarded batteries. I wrote to the factory where these batteries are made, and asked them what they would give for the old cells. They said they were hardly worth the cost of transportation and pulling to pieces; so now they are kicked around under foot like the copper wire.

A few days ago one of our men had a wheelbarrowful, and was going to dump them into the pond. I stopped him, and found, by using a battery-tester, that some of them had recuperated so that they would do very good service. You let a dry battery rest a while and it will rest up, like an old man. The reason why they last so long in ringing doorbells is because they have a chance to rest up between the calls. After this boy has gotten a wheelbarrowful of dry batteries or cells, let him hitch them up with some of these bits of copper wire. If he manages it right, this series of batteries will not only ring bells and run machinery, but it will light electric globes and give a very good light if it is rested often enough. The amount of light or work you get from such a system of batteries will depend on

the number you have and how good they are. The batteries can be put down cellar or in any out-of-the-way place, and you can carry the wires wherever you wish. I can not begin to tell you, dear friends, how much this knowledge of electricity and chemistry has been worth to me through a busy life. I told you, a little time back (see page 1025, Aug. 15), about a man who had canvassed our town of Medina, and sold a carload of gasoline-cans. He said that gasoline put into those cans, and kept there for twenty minutes, would become non-explosive in consequence of the electrical action of the apparatus in the can. I was able to tell him at once, from my knowledge of electricity and chemistry, that he was undertaking to rob the people. The carload of cans came here to Medina; but before our people had handed over their honest money we exposed him in our county paper. If you have a boy who is interested in studying up these things, by all means encourage him; for God alone knows how much he may be benefited by this knowledge when he gets to be fifty or sixty years old.

## HEALTH NOTES

---

### ROLLED WHEAT—CAN IT BE MADE AT HOME?

I am very much interested in the use of wheat, in the raw state, for human food. I wish you would let me know, if possible, how the wheat grain can be made, by domestic means, like the rolled wheat which is sold at the groceries. Or are there any simple devices in the market for this preparation so that any one would be able to make the rolled wheat from the grain at home? Any advice regarding this matter will be welcome.

San Francisco, Cal., Oct. 8.

J. FINEBURD.

Friend F., I have experimented somewhat in regard to this matter. Any of the various coffee or spice mills will crush and grind the wheat so it can be masticated almost as well as the rolled wheat, and perhaps quite as well. In regard to having the wheat perfectly clean, perhaps it had better be hand-picked, and it might be well to have it washed or scoured. Your wife can doubtless manage this. For a small amount, grind it in any kind of coffee-mill, but I would not try to grind it very fine. If some of the particles are too coarse to chew up readily, sift them out with a flour-sifter, such as women ordinarily use. Eat the dry ground wheat food with a spoon, using butter enough so that it will masticate nicely, and you will get the full benefit of the rolled wheat and save all the price of the middleman, the expense of fancy pasteboard packages, printing, etc. It does seem to me as if the average farmer ought to be able to make a short cut from the grain that grows in the home fields to the ground wheat placed right on his table. Of course, we want the very best quality of wheat; and I do believe that poor people with a little land could grow a little patch of wheat in their own garden; and when it is just right to use, say about the age of green corn, it is one of the most delicious and nourishing foods I ever tasted. It is some trouble to rub the grain out of the heads and blow off the chaff. If we had some cheap machine for doing the work I do think "green wheat," just out of the milk, might be as great a dish for the whole human family as "green corn," that is always in the market at the proper time, and afterward put up in cans.

## GRINDING WHEAT IN A COFFEE-MILL—MORE ABOUT IT.

A year or so ago I was out roaming through the woods picking up some chestnuts and walnuts—something I always delighted to do. Getting the smell of autumn leaves and crisp autumn air, gives life and vigor to a shop or store creature. Well, as I was strolling along, not noticing that I was quite near a barn, the owner seeing me came down to order me off the place; but seeming to recognize me he asked me up to the house. We sat on the veranda for some time, and talked. Somehow our conversation turned to this subject of wheat. The lady said she and her brother lived on this almost entirely—cracked wheat and cream. She insisted on my trying it, so she brought out a bowl of cracked wheat and cream. Talk about your patent breakfast foods! I never tasted any thing like that for fine flavor. On inquiry, they said they bought a bag of wheat from their grocer, and just ground it, when they wanted to use it, in a common coffee-mill, pouring cold water on it and letting it stand on the stove, so as not to burn, for from three to four hours. If you want to eat a royal dish, just try it. Take your coffee-mill and get all the coffee out of it. Rinse it out with warm water, and have it dry; otherwise you will find it hard work to grind the wheat. Use nice clean wheat, cracked as we used to crack corn, and cook it a good long time. In fact, you can not cook it too much. Now serve it with nice cream and a nice baked sweet apple cut up with it. I don't believe there is any thing a weak stomach will digest any better; and as for cathartic pills, you will never need them. This seems to be the most natural food man can eat—simple to prepare, and satisfying to appetite.

I immediately ordered half a bushel of wheat and used up the lot.

I find I don't care for a meat diet as much as I did in my younger days.

E. VANDERWERKEN.

Stamford, Conn., Oct. 29.

The above little story illustrates some recent experience of my own. While in Detroit attending the convention I went into a dairy lunch to get my breakfast. When I found some of my shredded biscuit and a bowl of nice milk I felt glad; and when I saw a large luscious baked apple right beside them, with some nice fresh cream, I felt gladder still. I made an excellent breakfast, and what do you think the bill was? A nickel for the shredded biscuit and the little bowl of milk, and another nickel for the baked apple and cream. It was all the breakfast I wanted, and I held out until noon very nicely.

In regard to grinding wheat in a coffee-mill, a friend suggests that a large coffee-mill, such as may be found in most of the city groceries, will grind a pound of wheat in a very few minutes; and he says the pound of wheat ground in this way is not only equal to any of the wheat preparations put up by the millionaire manufacturers, with a lot of fancy pasteboard and pretty pictures on it, but it is really fresher and more wholesome. If you use the wheat grown on your own farm (or your neighbor's farm) it costs you less than two cents a pound. If you patronize the poor millionaire because you are sorry for him, it will cost you fifteen cents a pound, including a pasteboard package, which is usually weighed up at the same price as wheat.

In regard to cooking the wheat, I prefer it Terry's fashion—uncooked; but if you must have it cooked a long while, as our friend states, the fireless cooker will do it to perfection. Put it into the cooker boiling hot, just as you go to bed, and the next morning it will be hot enough for breakfast.

Just after the above was dictated, *Good Health* for November was put into my hands; and on the front cover we have a very nice picture of Wu Ting Fang sitting in a crowd of men and women in the Battle Creek sanitarium. It is an excellent picture; and as Mr. Wu sits there in the foreground he is spreading out his hands and saying, "I am going to live 200 years." You see he has thrown friend Terry and myself into

the background. Is it not funny to see how "great minds (?) run in parallel channels?" Well, to get right down to it, where can the whole wide world show us a more praiseworthy undertaking? You can all join, and be right in the crowd "as long as you live," especially if you manage not only to *live* but to *keep well*. It makes me think of the old-fashioned spelling-school, and the way in which they let the best spellers go to the head of the class. The man or woman who demonstrates the truthfulness of her theories by living long and keeping the full use of her powers, both mental and physical, stands at the head of the class. It is refreshing to note that Mr. Wu so fully agrees with Terry and your humble servant—see page 1145, Sept. 15; and one of the grand and glorious things about this battle for good health and long life is that it is right in the line of "overcoming." The conditions of success depend upon pure, clean, temperate lives. "To him that overcometh will I grant to sit with me in my throne, even as I also overcame, and am set down with my Father in his throne."

A kind word has just come from an old friend. I think it will be a good closing for this health talk.

*Friend Root:*—If you are going to increase for the coming forty years in catholicity as you have in the past decade your usefulness will be very great; and that we may keep tab on you, continue your department in GLEANINGS.

R. A. BURNETT.

Chicago, Nov. 4.

By the way, I think it would pay every reader of GLEANINGS to send for the November number, at least, of *Good Health*. The account of Wu Ting Fang's visit to the sanitarium is alone worth the price of the journal for a year.

Since the above was in print I have ground some wheat in a coffee-mill, and compared it with the Pettijohn rolled wheat. There is no trouble in mastication; but the wheat that we find here in the market is evidently of poor quality compared with the Pettijohn. In our groceries the latter sells at 13 cts. a package; and the clean wheat, without the pasteboard box, weighed 1 lb. 6 oz.; so the cost here is only about 8 cts. per lb. for the finest quality of rolled wheat ready to be eaten.\* but it does seem too bad to pay even 8 cts. per lb. for wheat that is worth at home less than 2 cts. A good many people will doubtless find it less trouble to get their supplies at the nearest grocery than to prepare them at home. And even at 8 cts. per lb. the expense of good wholesome food is ever so much less than paying 50, 40, or even 25 cts. for a meal at a restaurant or boardinghouse. This same number of *Good Health* has quite an article on the importance of a certain amount, at least, of raw or uncooked food right along with your cooked meals—if you *must* have them cooked.

---

We clip the following from the *Budget*, of Sugar Creek, Ohio:

## SALOONS OUT: POLICE FOLLOW.

Goldengate, the third largest town in Wayne Co., Ill., has found it does not need a police force since the saloons are closed. On April 7, Goldengate voted out the saloons; and since then the office of marshal has been abolished as being a useless expenditure; and the town is now entirely without police protection.

---

\* Shredded-wheat biscuit costs us 13 cts. per lb., or 2 lbs. for 25 cts. Each package contains a dozen biscuits, so they cost about a cent apiece. This, I think, is partially cooked, and so far I give it the preference over any other cereal.

# YOUR HIDES AND OUR HIDES

## MADE INTO WARMTH FOR THE WHOLE FAMILY

We are the largest firm in the country that tans, manufacturers and sells all kinds of fur goods direct to the consumer. Our beautiful catalogue tells you how to get the best fur coats, robes, neckpieces, ladies' jackets, children's coats, fur-lined coats, etc., made to order, saving for yourself the jobbers' and retailers' profit. Our stock of hides and skins is complete. We furnish the material and manufacture to measure for automobilists, farmers, physicians, etc., and their families, all varieties of fur goods; or, we will tan, any kind of skins, wild and domestic, you send and make them into furs for any member of your family.

Don't sell your hides or skins. It's poor economy. Send them to us and have them made into coats, robes, mittens, jackets, ladies' furs, etc., and keep your family warm this winter. Any color horse or cow hide looks well. Our process makes them soft and pliable, also mothproof and waterproof.

No Matter Where You Live We Will Pay the Freight On  
All Hides Sent to Us to Be Made Into Coats or Robes

**FREE!**—With each cow or horse hide coat or robe made from hide furnished by you, we make free for you a pair of knit-lined mittens with horse-hide palms. Hear what Mr. Chestnut, Straw, Mont., says: I received the overcoat made from the hide I sent you. It is surely a dandy and those mittens made to match overcoat are all right. I am highly pleased with the goods.

You'll feel the same when you deal with us once. Send for new, handsome catalogue and learn all about our money-saving methods. Write today.

**National Fur and Tanning Company,**  
219 Hooker Ave., Three Rivers, Mich.

## PLEASURE AND PROFIT

**MAKE MORE MONEY**—Read this 128 to 200 page Magazine; published monthly and treats on the following subjects: Steel Traps, Where and How to Set, Bait and Scents; The Proper Season to Trap; How to Skin, Stretch, and Handle Furs; New Ways to Capture Mink, Fox, Wolf, Marten, Beaver, Otter, and Other Shy Animals; Raising Fur-bearing Animals; Growing Ginseng and Golden-Seal; Training Night-hunting Dogs; Leading Fur Markets; London Raw Fur Sales; Fox Hunting and Hounds; Coon Hunting; Letters from Old Hunters and Trappers, etc.

The Magazine contains from 128 to 200 pages each month, averaging about 160, or 2000 pages a year. About 700 illustrations used each year. Subscription price, \$1.00 a year. Single copy, 10 cents.

**STEEL TRAPS.**—All about the various makes and how to use them. Also chapters on care of pelts, etc. Contains 333 pages, 130 illustrations. Price 60 cents.

**MINK TRAPPING.**—Has all the methods of experienced trappers. Contains 183 pages, 53 illustrations. Price 60 cents.

**FOX TRAPPING.**—Devoted to ways of outwitting this wary animal. Contains 185 pages, 62 illustrations. Price 60 cents.

**DEADFALLS AND SNARES.**—How to build and set traps of the material the forest supplies. Contains 232 pages, 84 illustrations. 60c.

**CANADIAN WILDS.**—Tells about the Hudson Bay Company, Northern Indians, their ways of Hunting, Trapping, etc. 277 pages. 60c.

**LAND CRUISING AND PROSPECTING.**—Valuable book for Home-steaders, Hunters, Trappers, Prospectors, Guides, etc. Contains 175 pp., 36 illustrations. 60c.

**BEE HUNTING.**—There are wild bees in most forests. This book tells how to line bees to trees, etc. 80 pp. 25 cents.

A book of valuable information for growers of Ginseng and Golden-Seal, as well as collectors of medicinal roots, barks, leaves, etc. Tells how to grow and where found, medicinal uses, value, etc. Contains 317 pages, 5 x7 inches, and 130 illustrations.

Price, cloth, \$1

**A. U. HARDING PUBLISHING COMPANY, COLUMBUS, O.**

These Books are all Practical and Will Prove a Good Investment.  
Ten cents may be deducted from each book when two or more are ordered.  
32-page booklet, describing magazines and books, free.

# BOOKS of All Kinds on CREDIT

You can have all the books you need by our plan. Write for that beautifully illustrated and descriptive book.

"A Book Store in your home." It is free. Write today. We guarantee quality and value.

Our prices the lowest. Write for catalog. It is free.

The largest mail order Book house in the world. 48 years in business.

Dept. GB28 THE FRANKLIN-TURNER CO., 65-71 Ivy St., Atlanta, Ga.

# Grand FREE Millwork Catalog

Saves Users 50 Per Cent on Windows, Doors and Building Material

## Doors 77c—Windows 60c

**5,000 Bargains — Quality, Safe Delivery and Satisfaction Guaranteed Anywhere**

Don't think of doing any repair work or building, whether you are a Home Owner,

Carpenter, Contractor or Builder, until you have sent a postal card for our Free Millwork Catalog. It's an authority on millwork styles, and quotes and illustrates over 6,000 articles in sash, doors, flooring, stairs, roofing, building paper, hot bed sash, windows, screen doors, etc. We sell all our millwork products of the Largest Plant in America only direct to you, and you save HALF, whether you order \$5 worth or \$10,000 worth. We ship anywhere in the United States and guarantee to make you a clean saving, freight included, of from 25 to 50 per cent on anything you order.

You can get an idea by the few illustrations and prices in this small space of what a saving you can make by buying from our catalog.

Our work is all guaranteed strictly up to the official grades adopted by the Sash, Door & Blind Manufacturers' Association of the Northwest, and if

**4-Lt. Window 60c**  
With Glass,  
Dealer's Price, \$1.25

**Hot Bed Sash \$1.69**  
With Glass  
**Barn Sash, 4-lt. 39c**  
**Window Frames \$1.40**  
**Porch Columns \$1.85**  
**Stair Newels \$2.83**

not exactly as represented in every particular, you can ship your order back at our expense.

**Remember, you save 50 per cent, freight included, on your Local Dealer's Prices.**

We carry a large stock and can therefore ship promptly. If you are planning to do any building whatever, or to make any improvements, write us fully, stating what your needs are.

### Roofing at Cut Prices!

We ship to every state daily.

5-year guaranteed Flint-coated Roofing, per sq. **\$1.41**

8-year guaranteed Flint-coated Roofing, per sq. **1.96**

10-year guaranteed Flint-coated Roofing, per sq. **2.29**

### AERMOTOR GASOLINE PUMP

Engine complete ready to attach, as shown, to "any old pump," in 30 minutes

PRICE

**\$37 1/2**

THOUSANDS IN USE

**AERMOTOR CO.**  
CHICAGO

Makes and burns its own gas and produces a pure white, steady, safe, 100 candle power light. No wick, smoke, dirt, grease or odor.

**THE BEST LIGHT**

Lighted instantly. Over 200 styles. Agents wanted. Write for catalog

**THE BEST LIGHT CO.**  
306 E. 5th St., Canton, O.

### WHAT DO YOU SAY?

Several hundred thousand farmers say that the best investment they ever made was when they bought an

**Electric Handy Wagon**

Low wheels, wide tires; easy work, light draft. We'll sell you a set of the best steel wheels made for your old wagon. Spoke united with hub, guaranteed not to break nor work loose. Send for our catalogue and save money.

**ELECTRIC WHEEL CO., Box 95, Quincy, Ill.**

### Mend Your Own HARNESS

Put the money you would pay the repair man in your own pocket and use Myers Lock Stitch Awl instead. It stitches like a sewing machine and will mend harness, saddles, fur coats, robes, shoes,

**SEE THAT LOOP**

gloves, canvas, carpets, etc. Something you and your neighbors need every day and costs only \$1.00 prepaid. You can secure the agency in your locality and make money. One agent sold 100 in 4 days. Write for booklet

**C. A. MYERS CO.**  
6537 Woodlawn Ave., Chicago, Ill.

# 17 Cents a Day Buys an Oliver

This amazing offer—the New Model Oliver Typewriter No. 5 at 17 cents a day—is open to everybody, everywhere.

It's our new and immensely popular plan of selling Oliver Typewriters on little easy payments. The abandonment of long-hand in favor of clean, legible, beautiful *typewriting* is the next great step in human progress.

Already—in all lines of business and in all professions the use of *pen and ink* is largely restricted to the writing of *signatures*.

Business Colleges and High Schools, watchful of the trend of public sentiment, are training a vast army of young people in the use of Oliver Typewriters.

The prompt and generous response of the Oliver Typewriter Company to the world-wide demand for *universal typewriting*, gives tremendous impetus to the movement.

The Oliver, with the largest sale of any typewriter in existence, was the logical machine to take the initiative in bringing about the *universal use* of typewriters. It *always* leads!

## SAVE YOUR PENNIES AND OWN

## The OLIVER Typewriter

### THE STANDARD VISIBLE WRITER

This "17-Cents-a-Day" selling plan makes the Oliver as easy to own as to rent. It places the machine within easy reach of every home—every individual. A man's "cigar money"—a woman's "pin money"—will buy it.

Clerks on small salaries can now afford to own Olivers. By utilizing spare moments for practice they may fit themselves for more important positions.

School boys and school girls can buy Olivers by saving their pennies.

You can buy an Oliver on this plan at the regular catalog price—\$100. A small first payment brings the machine. Then you save 17 cents a day and pay monthly.

And the possession of an Oliver Typewriter enables you to *earn* money to finish paying for the machine.

### Advantages

The Oliver is the most highly perfected typewriter on the market—hence its 100 per cent efficiency.

Among its scores of conveniences are:

- the Balance Shift
- the Ruling Device
- the Double Release
- the Locomotive Base
- the Automatic Spacer
- the Automatic Tabulator
- the Disappearing Indicator
- the Adjustable Paper Fingers
- the Scientific Condensed Keyboard

Can you spend 17 Cents a day to better advantage than in the purchase of this wonderful machine?

Write for Special Easy-payment Proposition or see the nearest Oliver Agent.

**The Oliver Typewriter Co.**  
103 Dearborn St. Chicago.

### Service Possibilities

The Oliver Typewriter turns out more work—of better quality and greater variety—than any other writing machine. Simplicity, strength, ease of operation and visibility are the corner stones of its towering supremacy in

- Correspondence
- Card Index Work
- Tabulated Reports
- Follow-up Systems
- Manifolding Service
- Addressing Envelopes
- Working on Ruled Forms
- Cutting Mimeograph Stencils.

## Why Rent?

when there are 500 Government irrigated homesteads at Powell, in the Big Horn Basin, Wyoming and Hunley in the Yellowstone Valley, Montana, with water now running in the canals, ready to raise crop next year.

**WATER PAYMENTS EASY AS RENT,** one-tenth cash, one-tenth in two years and one-tenth each year thereafter until full amount is paid. **NO INTEREST.** Settlers allowed to work out payments on extensions of Government Canal at good wages. A never failing supply of water for irrigation.

**YIELDS:** 50 bu. wheat, 90 bu. oats, 70 bu. barley, 3 cuttings alfalfa, 250 to 500 bu. of potatoes, 20 to 25 tons of sugar beets. Good fruit land.

**Let Us Help You Locate.** Go with me on one of our personally conducted excursions, first and third Tuesdays of each month, and I will help you **free of charge** to find a satisfactory homestead, or purchase deeded or Carey Act land. I will not advise you to settle where the elevation is too high, or the water supply defective.

**Write Today** for our new folder with large map, also folders issued by the Government telling about the homestead lands.

D. Clem Deaver, Gen. Agt.,  
Landseekers' Information Bureau,  
41 "Q" Building  
Omaha, Neb.

# Don't Buy a Stove or Range Until You First See How Much You Save By Getting

## "A Kalamazoo Direct to You"

TRADE MARK REGISTERED

**Y**OU want to make every cent you spend this year, count for quality and economy.

If you need a stove or range, don't buy until you get our **factory prices**. I promise you that I will save you \$5, \$6 or \$10 on our smallest stoves, and as high as \$18, \$20 and even \$30 on our largest. And I promise you that you cannot get **anywhere at any price**, a better stove or range than the Kalamazoo.

Just let me quote you prices. Take our catalogue and **compare the Kalamazoo quality and prices**, with the best line of stoves and ranges you can find sold at retail. That will tell the story. You can see for yourself. You want to save money and you want to get high quality. Why not investigate our plan, then? Why not let me show you the difference between manufacturers' prices and retail prices on stoves or ranges?

We sell to you, direct from the factory, at actual factory prices,

### On 360 Days Approval Test—We Pay the Freight

I promise, in black and white, to refund your money—every cent of it—if you do not find your purchase in every way exactly as represented.

Remember, every Kalamazoo is of the highest possible grade, made of the best materials and in the best manner. You deal directly with the manufacturers—a company that has a larger number of individual customers than any other stove company in existence. We have sold thousands of stoves and ranges to readers of this journal, and no doubt can refer you to near neighbors who have saved money by buying a Kalamazoo. Many customers write that they have saved enough on a single Kalamazoo to pay for a whole season's fuel. You can save enough to buy a new suit, a new dress, an article of furniture, or perhaps to pay your taxes. Is it not to your interest to get our prices?

All Kalamazoo cook stoves and ranges have patent thermometers which make baking and roasting easy.

### Send Postal for Catalogue No. 416

describing more than 300 sizes and styles of Coal and Wood Ranges, Coal and Wood Heaters, Hotel Ranges, Base Burners, Laundry Stoves, Etc.

I know that if you get our prices—and see our quality you will not even think of buying any other make. Let me show you how much you can save.

The Southern Fruit-Grower is the Best Paper that I Have Ever Read.

—L. H. KESSLER, Agawam, Mass.

I have been a regular subscriber to The Southern Fruit-Grower, almost from its beginning, and enjoy it very much.—J. B. WILLIS, Spartanburg, S. C.

I am nearly 80 years old, still I do not feel like being without The Southern Fruit-Grower.—A. BORNSTEIN, Cedar Hill, Tenn.

THESE are only a few of thousands of subscribers to The Southern Fruit-Grower who tell us what they think of it, after reading it for a number of years. If you have a garden, orchard, or even a few trees, you will find it of inestimable value to you. It will save you many dollars each year. We want your subscription, so that you may join with the others in testifying to the value of our paper. It is published monthly, 24 to 32 pages. Clean and crisp. 50 cents per annum; three years for \$1.00. We want three-year subscriptions.

YOU NEED A GOOD PRUNING-SHEAR.

Fill out the coupon below and send it to us, and we will send you a copy of The Southern Fruit-Grower and a pair of these steel pruning-shears on approval. If you think it a splendid offer, keep the

shears and send us \$1.00, otherwise return the shears to us. (Sample copy free.)

THE SOUTHERN FRUIT-GROWER, CHATTANOOGA, TENN.

The Southern Fruit-Grower, Chattanooga, Tenn.

Send me a pair of pruning-shears and a copy of The Southern Fruit-Grower on approval. I will send you \$1.00 for the shears and three years' subscription to The Southern Fruit-Grower, otherwise I will return the shears within ten days.

A Year's Work in an Out-apiary

or, How to Control Swarming with Any Hive, Either for the Production of Comb or Extracted Honey. By G. M. DOOLITTLE.

Price 50 cts. postpaid.

This is the long-promised volume, just issued from the press of The A. I. Root Company. It contains 60 pages the size of this journal, describing Doolittle's system of comb-honey production, and how he managed to control swarming in particular. He has been writing on the subject of bees for over forty years. During all of that time he has made his bees pay, and pay handsomely. Just how he has been doing this is fully explained in this work.

The regular price of this work is 50 cents; but to introduce it among our readers we offer it in combination with one year's subscription to GLEANINGS for the regular price of the journal; namely, \$1.00, providing all arrearages are paid, if any; and \$1.00 for one year in advance. Those whose subscriptions are about to expire should renew at once, for the condition of our offer is that the subscription money, \$1.00, must be received before the expiration of your subscription. As there have been only a limited number of copies of the book printed, if you desire to secure one you had better renew at once, even if your subscription has some time to run, so as to be sure to get one.

GLEANINGS IN BEE CULTURE, MEDINA, O.

BEAUTIFUL Post Cards Free

Here are 12 as handsome Post Cards as you have ever seen. The flower cards are all embossed—raised flowers. There are six of these. The other six are scenes like the one above—all beautiful and grand—nothing cheap or small about any of them. These twelve cards will be sent to anyone FREE. Just send a dime—stamps or coin—for a three months' trial subscription to Farm and Stock, the One Best Farm Paper. This paper will delight you. It is the best on following subjects: Corn Growing, Stock Raising, Farm Veterinary, Farm Women, Dairying, Poultry Raising, Fruit and Bees, etc. Write at once.

FARM & STOCK

P. O. Box 404

St. Joseph, Mo.

FASHION BOOK FREE!

I want to send you my handsome new book showing hundreds of latest styles with illustrated lessons on cutting and dressmaking. I will agree to sell you all the patterns you want for five cts. each. They are the same patterns you have always paid 10c & 15c for at the stores, made by the same people, and correct in every detail.

HOW I DO IT.

I publish the **FARMER'S CALL**, a weekly paper for every member of the family. An especially interesting feature each week are the children's letters; and the Woman's Department is unusually strong and instructive. Among the special features for Women folks, is its fashions in which I show the 5c patterns. Let me help you to save money.

MY SPECIAL OFFER

Send me 25c and I will send you the **FARMER'S Call** every week (over 1000 pages) for one year and will send my big Fashion Book to you free. I also agree to sell you any pattern you want thereafter for 5c. I can sell them for 5 cts because I buy them by the thousand and don't make any profit. I don't want the profit. I want your subscription to the **FARMER'S CALL**. You will save many times the cost of my offer in a year. **WRITE TO-DAY!**

Shipping-cases

for any number or size of sections desired. These cases are made of fine white basswood, and the workmanship is first class. Owing to the shortage in the honey crop last year we have a good stock on hand and can make immediate shipment.

Twelve-inch case, with follower, to hold 24; or eight-inch case, with follower, to hold twelve beeway sections, shipped when no size is mentioned. All cases single tier unless otherwise ordered.

Honey-packages in Tin.

Standard packages for storing and shipping extracted honey. Less chance for leakage or taint from wood; being square they economize space. Five-gallon cans boxed two or one in a box; gallon cans 10, ½-gallon cans 12 to box. Five, one, or ½ gallon cans not boxed if desired. Prices on application for any quantity.

Place your order now; prices and prompt shipment guaranteed.

Honey and Wax for Sale

FOR SALE.—To reduce stock I offer for sale as follows: 26 cases of stock No. 40, and 40 cases of stock No. 44 at \$10.80 per case of two 60-lb. (new) cans. This is a raspberry-basswood blend, and is the cream of two apiaries; being extracted from select all-sealed upper stories. A third of a century's experience in the production of fine extracted honey. Ask for my little circular "A Word about Extracted Honey;" this will explain why it pays to buy this delicious stock.

E. D. TOWNSEND, Remus, Mich.

LISTEN!—The two cases of honey are received, and I am greatly pleased with it. I don't think I ever saw finer honey in my life.

E. W. PEIRCE, Zanesville, Ohio.

You will be just as well pleased with your honey as Mr. Peirce if you send your order to JAY NORTH, of North Adams, Mich. One 60-lb. can, 8½ cts.; two 60-lb. cans, 8½ cts. For larger orders write for prices. Sample free.

FOR SALE.—My new crop of white-clover extracted honey. Honey has been left in full charge of the bees for three weeks after harvest, and is rich, waxy, and of fine flavor, and is as good as a specialist can produce. Price is 8c. per lb. by the case of 120 lbs. or for the entire crop. Cash to accompany order.

LEONARD S. GRIGGS, 711 Avon St., Flint, Mich.

RASPBERRY HONEY, left on the hives until thoroughly ripened; thick, rich, delicious; put up in new 60-lb. tin cans; \$6.25 for one can; two or more cans at \$6.00 per can. A few cans left of the "off color" raspberry honey at \$5.50 per can. Sample of either kind, ten cents, and the ten cents may apply on the first order.

W. Z. HUTCHINSON, Flint, Mich.

FOR SALE.—Comb honey, amber, buckwheat, and No. 2 white, at \$2.75 per case of 24 sections; in 25-case lots, 5 per cent off; light amber extracted (three-fourths clover), in 60-lb. cans, two to case, at 8 cts.

QUIRIN-THÉ-QUEEN-BREEDER,
Bellevue, Ohio.

FOR SALE.—Write for prices on clover, basswood, and buckwheat honey in 60-lb. cans and kegs; also comb honey and beeswax, all guaranteed to be pure.

W. L. COGGSHALL, Groton, N. Y.

FOR SALE.—Choice extracted honey for table use, gathered from clover and basswood—thick, well ripened, delicious flavor. Price 9 cts. per lb. in 60-lb. cans, two to case. Sample, 10 cts.

J. P. MOORE, Queen-breeder, Morgan, Ky.

FOR SALE.—I have some extracted honey, well-ripened, fine, clover and basswood, in new five-gallon round cans, at \$5.50 a can; sample free; delivered f. o. b. cans here; ought to suit anybody.

MATHILDE CANDLER, Cassville, Wis.

FOR SALE.—Three thousand pounds of fine buckwheat honey in new cans. Send for sample and prices.

EARL RULISON, Rt. 1, Amsterdam, N. Y.

FOR SALE.—Clover, amber, and buckwheat extracted honey. Table quality. Write for prices, stating your needs.

C. J. BALDRIDGE, Homestead Farm, Kendaia, N. Y.

FOR SALE.—Honey, clover, or buckwheat, comb or extracted. Write for price. Sample of clover extracted free. State quantity and quality desired.

C. B. HOWARD, Romulus, N. Y.

FOR SALE.—Choice white-clover extracted honey, in new 60-lb. cans, or any shape desired. Ripened on the hives and guaranteed strictly pure. Sample free.

J. F. MOORE, Tiffin, O.

FOR SALE.—Fancy comb honey shipped in no-drip shipping-cases at \$3.15 per case of 24 sections. Address

HENRY CABLE, Reynoldsville, Pa. Rt. 1.

FOR SALE.—3000 lbs. clover extracted honey in 60-lb. cans. Fully ripened on hives; 9 cts. per lb., f. o. b. here. Sample free.

E. S. MILLER, Valparaiso, Ind.

FOR SALE.—Well-ripened white-clover honey in 60-lb. cans, at \$5.40 per can. Fall honey same price.

ARTHUR SCHULTZ, Ripon, Wis.

FOR SALE.—Fancy and No. 1 white-clover comb honey.
ANTON G. ANDERSON, Holden, Mo.

Honey and Wax Wanted

WANTED.—Comb, extracted honey, and beeswax. State price, kind, and quantity.

R. A. BURNETT, 199 South Water Street, Chicago, Ill.

SPECIAL NOTICES

By Our Business Manager

LINCOLN FARM ALMANAC.

Your attention is especially desired in the case of the Lincoln Farm Almanac now advertised on the inside front cover page. It is one of the best offers we ever made.

A BARGAIN IN SQUARE JARS.

In order to reduce a surplus stock we are prepared to offer a special bargain in square jars of small size. These are put up 100 to the crate, and, including corks, we offer them as follows: 5-oz. square Powder jars, including corks, \$2.00 per 100; 1/2-lb. square Powder jars, including corks, \$2.25 per 100. In 500 lots you may deduct 5 per cent, and in 1000 lots 10 per cent from above prices. To make a really neat and attractive finish, tinfoil caps should be added. We will include these at 25 cents per 100 extra, either size. This is a much handsomer package than a tumbler or jelly-glass, and at these prices it costs little if any more. Our stock offered at this price is limited, and the price holds only while the stock lasts. Shipments can be made only while the stock lasts. Shipments can be made only from Medina, at which point only are these jars in stock.

TEMPERANCE

THE ANTI-SALOON LEAGUE, AND WHAT IT PROPOSES TO DO.

I have been much impressed by a little sentence that I found in the *Missouri Issue* for Oct. 30. In speaking of the Anti-saloon League and its mission it uses the following words:

It proposes that we shall all unite to do something that we are all agreed upon, without reserve as to what any of us think about any thing else. It refuses to quarrel with its natural friends.

I have put them in italics because I want you to read it over carefully and thoughtfully. In fact, I think it will pay to read it over a good many times.

What I have in mind just now is the relation of the Anti-saloon League to the Prohibition party. To tell the truth, I have just sent them ten dollars to make me a life-long subscriber to the *National Prohibitionist*. I explained to them that I was one of the charter members of the Anti-saloon League, and had been contributing pretty heavily toward it ever since it was started; and I suggested to them that, while these two great organizations are both working for temperance and for abolishing the saloon, and in the end bring about prohibition throughout the whole wide world, we certainly did not need to be hitting at each other, even if we do not think just alike. Then I asked the editor if some of his people could not vote for Governor Harris while he was coming out so vehemently for our county local-option work which is making such progress here in Ohio; but they seemed to think that I was, in so doing, "building up with one hand and tearing down with the other." Of course, this was in a private letter; but since then some unkind flings, that looked to me like unnecessary criticisms, have appeared in print in regard to our good Governor; and just because of the lack of a little help from our zealous friends of the Prohibition party we are turned over to the mercies of one who, at least, does not think best to come out so strongly for temperance. As I want to be loyal to the Governor who has been chosen by the majority of our people, I hope and pray he may not do any thing that will hinder the wave of reform that is still blessing our State of Ohio.

THE WRIGHT BROTHERS UP TO DATE.

While the French Senate was in session Wilbur Wright was called on to make a speech. Now, from what I know of Wilbur I do not imagine he would make a very long speech, but that when he did make one it would be right to the point, and I think you will agree with me when you read it. Here it is:

I sometimes think that this indescribable desire to fly through space after the manner of birds is an inherited longing transmitted to us from our ancestors, who, in their toilsome journeys through the wilderness in primeval times, looked up and saw the birds shooting at almost lightning speed wherever they willed in the unobstructed pathways of the heavens.

Mr. Wright concluded by saying that he told his brother Orville in 1901 that men would not fly in fifty years, and yet he said they flew in 1902.

JUST ONE OF MY BLUNDERS.

On page 1334, Nov. 1, in speaking of Wilbur Wright's "accident" I meant his brother, Orville

Wright. I am very sorry indeed if any blunder of mine has conveyed the idea that any thing has marred Wilbur's very successful flights at Le Mans.

WILBUR WRIGHT INSTRUCTING PUPILS IN THE ART OF FLYING.

Several times I have remarked that if any accident should happen to the Wright Brothers it might be a difficult matter to find anybody on the face of our great round globe who could run the machine without some previous practice or experience with the Wrights as teachers. In view of this it rejoices my heart to know that the work of teaching is already under way, and that our good friend Wilbur has at least one pupil. See the following, which I clip from the *Cleveland Plain Dealer*, dated at Le Mans, France, Nov. 10:

Captain Lucas Girardville, of the French army, made a flight of 15 minutes with Wilbur Wright, the American aeroplanist, today, receiving his first lesson in piloting.

I suppose most of our readers are aware that Wilbur has received the \$100,000 for the right to make and use his flying-machine in France.

Orville returned to his home in Dayton, O., in time to vote, and is able to get around, at least after a fashion, by the aid of crutches.

WU TING FANG IS NOW INVESTIGATING UNCOOKED FOODS.

Wu Ting Fang, the Chinese minister, who is now investigating American customs and inventions, is looking up the matter of uncooked foods—see page 1394; also the following which I clip from the *Woman's National Daily*:

UNCOOKED DINNER SERVED.

LAKEWOOD, N. J., Nov. 8.—Mr. and Mrs. Eugene Christian had as their guests Minister Wu Ting Fang, of China, and Vice-Consul L. Wing at a dinner at which every thing in the way of food was served uncooked. A large number of dishes were served in courses.

Perhaps I should explain to our friends that Mr. and Mrs. Eugene Christian are prominent exponents and venders of uncooked foods.

"TAKING STOCK" IN NEW ENTERPRISES THAT ARE JUST COMING UP, ETC.

Be careful how you invest your money with anybody or any company who would persuade you through the papers that they have got a "big thing," and are making money so fast that, out of the kindness of their heart (?), they would like to divide this good thing with other "good people" who have money to invest. Perhaps there is some sarcasm in the above, but I can not help it; and it vexes me more because of late some people and some institutions that have had a good reputation in times past are begging the public through their advertisements "to get in on the ground floor" and "get rich" with them. A good praiseworthy institution does not have to go out begging in order to get people to invest.

DAN WHITE AND HIS DANDY STRAWBERRIES.

I marketed 500 bushels of berries this season. I now have six acres for next season in good shape considering the long drouth. I will soon write an article as you request. DAN WHITE.
New London, Ohio, Nov. 10.

Before buying your Comb Foundation, or disposing of your beeswax, be sure to get our prices on wax and foundation, or our prices on working wax into foundation.

STRETCH A BULL DOG—superior elasticity, which means more wear and comfort, is instantly noticed

Packed in handsome single-pair boxes, they are the most useful, satisfying gift you can buy anywhere for 50 cents

EVERY MAN, YOUTH AND BOY WILL GLADLY RECEIVE THEM

HEWES & POTTER, Makers

Dept. 3298

87 Lincoln St., Boston, Mass.

Write for our instructive free booklet, "Style, or How to Dress Correctly," which contains valuable gift suggestions. For 10 cents postage, we will send our useful BULL DOG Girth and brace.

Why Do You Remain

in a section where the climatic conditions are so against you, where it is necessary to battle with the rigors of a long winter?

Wouldn't You Like

to be permitted to carry on work out-of-doors throughout the entire year? A location in our southern territory offers many opportunities and advantages, and makes life a pleasure the year round. The lands can be obtained at reasonable prices, they are equally as productive as yours, prices as good, if not better, for your crops, and no long winters of ice and snow to contend with.

The Seaboard Air Line Railway

through its Industrial Department, is anxious to assist you in bettering your present condition. Literature will be sent free upon request. Ask for copy of "FRUIT AND VEGETABLE GROWING" in the Land of Manatee, written by a western man, containing descriptive data, profits derived from various crops, etc.

Special Rates

November 24th

The lowest rate ever offered for the benefit of prospectors and homeseekers will be in effect from certain points on Nov. 24th. Let us help you take advantage of this opportunity to make a trip of investigation at very little cost. Write for full particulars.

Texas Land \$1.00

To \$5.00 Per Acre

Texas has passed new School Land Laws. Millions of acres are now to be sold by the State at \$1.00 to \$5.00 per acre; only one-fortieth cash and no more to pay for 40 years, unless you desire; only 3 per cent interest. You can buy 160 acres at \$1.00 per acre, payable \$4.00 down and 40 years' time on the balance, 3% interest. Greatest opportunity ever offered to investors and farmers. Texas land is better than Oklahoma, Iowa or Illinois. Send 50 cents for Book of Instructions, New State Law, Map of Texas, and brief description of over 400 million acres of vacant public lands in 25 different States, which are open to homestead. Three Books for \$1.00.

E. C. HOWE, 938 Hartford Building, CHICAGO, ILL.

9,059-Word Business Book Free

Simply send us a postal and ask for which free illustrated 9,059-word Business Booklet which tells how priceless Business Experience, squeezed from the lives of 112 big, broad, brainy business men may be made yours—yours to boost your salary, to increase your profits. This free booklet deals with

- How to manage a business
- How to sell goods
- How to get money by mail
- How to buy at rock-bottom
- How to collect money

Honey Markets.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent), cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

For grading rules, both Eastern and Colorado, see previous issues.

CINCINNATI.—The market on comb honey is more active, and there are some large lots moving. There will be no big prices, due to the fact that there is considerable old honey left over from last year. No. 1 white comb honey is selling at 14 to 15 in small lots; dark or off grades are not selling at any price, as there is no demand for them. Amber honey is in good demand at 6½ to 7. White-clover honey is selling at 8 cts. in 60-lb. cans; water-white sage, fancy, 9. Beeswax is in fair demand at 30. The above quotations are what we are selling at.

C. H. W. WEBER,
Cincinnati, O.

Nov. 21.

ZANESVILLE.—The generally quiet condition of business continues to affect the demand for honey. Both comb and extracted are moving slowly, though some revival is anticipated between now and the holidays. Most of the honey now on this market is of very good quality. The jobbing trade is offering producers 12½ to 13 for fancy white comb, and 12 to 12½ cts. for No. 1, and for best clover extracted, 7 to 8—no demand for off grades, and practically no change in the wholesale market since the last report. I offer for good yellow beeswax 29 to 30, according to quality; 30 to 31 in exchange for bee-supplies.

E. W. PEIRCE,
Zanesville, O.

Nov. 21.

INDIANAPOLIS.—While prices are not high, the demand for honey has never been better—a fact that can be attributed to the quality of goods now on our market. This is a white-clover district, and our market is almost free from honey from other sources. Producers are offering fancy white comb at 12½; No. 1 white, 12; white clover, extracted, in five-gallon cans, 7. Some amber honey is being offered, but the demand is not sufficient to establish a price. Beeswax is steady at 28 cts. cash, or 30 cts in exchange for merchandise.

WALTER S. POWDER, Indianapolis.

Nov. 19.

CHICAGO.—The volume of business is not normal, yet there is some honey selling all the time. It looks as though the people were going to use more of it through the winter than has been the case for the last few years; but they are going to buy it as they want it, reasoning that they can get it as needed. Prices are steady at 13 to 14 for A No. 1 to fancy, other grades ranging from 1 to 3 cts. per lb. less. Extracted white ranges from 7 to 8 according to quality, flavor, and style of package. The amber grades from 6 to 7. Beeswax is steady, and sells upon arrival at 30 if free from impurities.

R. A. BURNETT & Co.,
Chicago.

Nov. 18.

SCHENECTADY.—There has been quite a demand for extracted honey from the wholesale trade during the past week, but comb stock is moving very slowly, while receipts are in excess of sales. We look for some improvement this week on account of the stimulating effect of Thanksgiving holiday on trade generally. We quote fancy clover, white, 15 to 16; No. 1, 14 to 15; fair to good, 12 to 13; buckwheat, fancy, 12 to 12½; fair to good, 10 to 11. Extracted, dark, in 60-lb. cans and 160-lb. kegs, 6½ to 7½; light, 7 to 8. Beeswax, without demand.

CHAS. McCULLOCH,
Schenectady, N. Y.

Nov. 18.

SAN FRANCISCO.—Comparatively little honey is arriving at present, and stocks in this market are light. Trading, however, is quiet, and sales are made at the former figures. Water-white comb, per lb., 16 to 17; white, 15; water-white extracted, 8 to 8½; light amber, 7 to 7½; dark amber, 5½ to 5¾; candied, 5½ to 5¾.—*Pacific Rural Press*, Nov. 14.

ST. PAUL.—Receipts of honey are very light; demand moderate, and prices steady. The prices below represent those obtained for shipment in small lots: Fancy white-clover and basswood, new, 13 to 14; buckwheat, 10 to 12½; extracted in 60-lb. cans, 7 to 8.—*Board of Trade Bulletin*, Nov. 9.

LIVERPOOL.—There is no change in prices, and stocks are small. Chilean, 4¼ to 6½; Peruvian, 3½ to 4¼; California, 8½ to 10½; Jamaican, 4 to 5; Haiti, 5 to 7. Beeswax, firm. African, 26¼ to 28; American, 30 to 33; West Indian, 29 to 32; Chilean, 30 to 35; Peruvian, 33; Jamaican, 34 to 35.

TAYLOR & Co.,
7 Tithebarn St.

Nov. 9.

ALBANY.—The honey market is easier under heavier receipts. While we do not change the asking price, we make concessions rather than lose sales. The crop in this vicinity is less than usual, but there are more people unemployed now than a year ago. We quote fancy clover, 15; No. 1, 14; mixed, 13; buckwheat, 12 to 13; extracted white, 7½ to 8; amber, 7; buckwheat, 7. Beeswax, 30 to 32.

H. R. WRIGHT, Albany.

Nov. 17.

KANSAS CITY.—Market is well supplied with comb honey. Demand fairly good. Prices are as follows: Fancy comb in 24-section cases, at \$2.90 to \$3.00 per case; No. 1 at \$2.75; No. 2, \$2.50. Extracted, 7 to 8 cts. per lb. Beeswax, 28 cts.

C. C. CLEMONS PRODUCE CO.,
Kansas City, Mo.

Nov. 21.

BOSTON.—White fancy comb honey, 15 to 16. No. 1 ditto, 13 to 14; extracted white, 9 to 10; extracted amber, 7 to 8; amber in barrels, 6 to 7. Beeswax, 30. BLAKE-LEE CO.,
4 Chatham Row, Boston, Mass.

60 Cents for 5 Years
(Club Rate)

What Forces Us to Do This The advancing price of paper and of labor, and the yearly increase in number of pages printed, the larger sums paid for editorial knowledge and skill, and the conviction that we have been giving too much for the money. All have been strong arguments. In all human probability, the price of this paper will never again be so low. It is

Now or Never if you want to subscribe at the old rates. Send a dollar bill, and protect yourself for ten years against this increase and any future ones. It is perfectly safe—we'll change your address as often as you please, and get the paper to you if you are on this planet. Ask any subscriber, or your bank, whether or not we carry out our promises. You have often thought of taking the FARM JOURNAL; sooner or later you are sure to need it. One dollar 10 years, 60 cents 5 years, until January 30.

SUBSCRIBE NOW AND SAVE MONEY

A free copy of the 1909 Lincoln Farm Almanac if your order reaches us by January 4. The Lincoln Almanac contains new and old Lincoln stories, sayings, the Gettysburg speech, calendars for the year, of course; and 24 pages of valuable farm information—curing meats, spraying and planting tables, household recipes, grafting, good roads, etc. etc. All free if you are prompt.

NOTICE We still sell any BIGGLE BOOK with Farm Journal 5 years for \$1.00, as advertised last month, and send the book on 10 days' approval. The books are: POULTRY, HORSE, Garden, Orchard, Cow, Swine, Sheep, Berry, Pet and Health. Per Volume, 50c Postpaid

No Letter is Necessary Cut out this advertisement, write your name and address on the margin, and enclose with the money in a strong envelope addressed to

FARM JOURNAL, 1083 Race St., Philadelphia

Until January 30, new subscribers can get Farm Journal two years on trial for 25 cents. An Almanac, too. No one-year orders accepted.

15 Cents a Rod

For a 22-inch Hog Fence; 16¢ for 26-inch; 19¢ for 31-inch; 22 1-2¢ for 34-inch; 27¢ for a 47-inch Farm Fence. 50-inch Poultry Fence 37¢. Lowest prices ever made. Sold on 30 days trial. Catalog free. Write for it today.

KITSELMAN BROS.

GREAT OPPORTUNITIES IN THE WEST.

Many Eastern people labor under the misapprehension that the great West is pretty well filled up, and, consequently, golden opportunities are no more, and conditions are very little if any better than where they are. No greater fallacy could be entertained. For example, the Chicago, Milwaukee & St. Paul Railway, which is now advertising in these pages, is laying rails at the rate of two miles a day through a virgin country where "great empires to be" are mere babies. There are no finer countries under the sun, either as to climate or resources. All they need is a population of plucky, intelligent, hard-working thrifty people. Nature will do the rest. As to bee-keeping, there are many opportunities. Last summer one settlement (the Yakima Valley) produced over 100 tons of the finest honey. Doubtless there are and will be many more just such places. Bees seldom fail to return a crop. Fruit-bloom in the spring and great crops of alfalfa in summer insure certain returns because the summer weather is always favorable—no rain to interrupt. There are also at certain times great masses of wild flowers. The people are of the best possible class, with fine schools and plenty of church accommodations. It is an ideal country. Take the chance and go and see.

SAVING THE HEAT.

Everybody who has to do with house-heating by means of stoves, knows that an enormous proportion of the heat generated is wasted altogether by passing out at the chimney-top. Many inventors have tried their hand at devising something to arrest this great waste of fuel. Perhaps the best invention of this kind is the radiator made by the Rochester Radiator Co. This consists of a series of cross-tubes which arrest a considerable amount of the heat and throw the same into the room. The invention is simple and practical, easily understood and fitted up. Like all good inventions it has been copied by other manufacturers who make a somewhat inferior article, as is usually the case with those who copy. We advise our readers who want the best thing of the kind to go to the fountain head, The Rochester Radiator Co. We believe they are perfectly honorable and straightforward business men, anxious to give complete satisfaction to all purchasers of their radiators. They will do their best to furnish a radiator suitable to your heater if you will carefully describe your arrangement for heating. Write them.

BANKING BY MAIL

MR. RICE, THE "PAINT MAN."

It is with pleasure we announce the fact that Mr. Rice "The Paint Man" is again a user of these columns. We are always glad to see an old friend return to the fold, and in this case we are peculiarly gratified because it shows our readers are users of paint. It indicates tidiness and general neatness, and also care to be a user of paint. The kind of paint sold by Mr. Rice is such that almost any one can afford to be liberal with it, and that is a great point. It requires no oil, and therefore effects a great saving. Thousands of customers have used it with satisfaction, so it is no experiment whatever. There are many who insist that oil in a paint is entirely unnecessary, and it begins to look like it when one reads the testimonials submitted by Mr. Rice. If you are a user of paint, large or small, we believe it will pay you to get in touch with Mr. Rice. We think that on careful and mature investigation, backed up by a careful trial, you will decide that oilless paint has real merit and is worthy of extended use for many purposes around the farm home.

A SPLENDID CHRISTMAS PRESENT.

Very few articles are more appropriate for Christmas presents than fountain pens of good quality. Such a pen in one's pocket is always handy and is a constant reminder of the one who gave it. Good fountain pens can now be obtained for the sum of \$1.00 from the Laughlin Fountain Pen Co. who advertise in this journal. Formerly as found a pen sold for \$2.50 or thereabouts. Now they are within the reach of all at a dollar each. The Red Gem is particularly desirable as it may be slipped into the vest pocket unlike the ordinary pen. It will be a hard matter to find a nicer Christmas present. It writes just like an ordinary pencil and requires no special attention to keep it in order. The lead pencil has an awkward way of breaking just when one wants it most, but the Red Gem writes a long time before it requires a fresh supply of ink. The Laughlin Co. are so sure they have a good thing that they make an extremely liberal offer to those who find they do not want the pens after trying them. It is the "square-deal" principle carried clear out to the end. Nothing could be fairer.

A WOODEN SITTING HEN.

Mr. George H. Stahl, the celebrated maker of wooden hens, is again using these columns to make known their merits to the whole world. Mr. Stahl is one of the pioneer makers of incuba-

tors in America. It does not seem necessary for us to enlarge on the merits of his manufactures, as he must be well known to many of our older readers, for he has periodically used these columns for a number of years. If you are in want of an incubator this season we would suggest that you write Mr. Stahl, stating your desires.

WINDBREAKS FOR THE FARM.

In the Central States and the Mississippi Valley there exists an absolute necessity for good windbreaks to protect from the chilly blasts all kinds of farm stock and crops. In many sections windbreaks are very necessary for the protection of fruit-trees, vegetables, and farm crops. Many farmhouses could be rendered far pleasanter by the addition of good strong windbreaks. They take the sting out of the wind, and rob the "norther" of its terrors. It is not a difficult proposition to get a windbreak. If you will write to The Gardner Nursery Co., box 26, Osage, Iowa, they will tell you just what you ought to plant, how to plant, and the cost of the trees. They have trees on purpose to resist blizzards. In a few short years you will be proud of your windbreak if you go to work and plant it now. It will be an improvement which will add much to the selling value of the farm—far more than it costs you. The same concern also sells fruit-trees suitable for the blizzard belt. They have also a line of hardy ornamentals so that they are in position to supply all the trees a farmer needs for the adornment and protection of his home.

THE "IDEAL" INCUBATOR.

Nowadays there are a great many makers of incubators in the world, and more particularly in the United States. One of the most reliable firms of incubator-manufacturers is the J. W. Miller Co., box 48, Freeport, Ill. They make a nice line of medium-priced chick-machines which will compare very favorably with those made anywhere, quality and price being both considered in the deal. They have been in that business for a quarter of a century, hence their reputation is made, and they are not under the necessity of making big statements to draw attention to their wares. Their advertisement, which is inserted elsewhere in this paper, is quite modest, but they do a large trade nevertheless, because they are widely and favorably known among poultry-breeders all over America and across the ocean as well. They issue a very fine catalog which is sure to interest every lover of poultry, no matter how small his place may be. Write for it right now.

GRUMIAUX

THE MAGAZINE MAN

Let Me Teach You

..THE MAGAZINE SUBSCRIPTION GAME.. A BUSINESS WITH A BIG FUTURE

How I Developed My Business from \$47 to \$400,000 a Year

The subscription agency-business is just beginning to develop, and every man and woman can learn it by my complete instructions, personally conducted by mail. You can in your leisure hours conduct a mail-order business that is dignified and earn **large profits** by the **Grumiaux System**.

Begin in a small way and watch it grow. The principles upon which I built my business become yours and the benefits of my 22 years' experience—you need not make the mistakes I did—the elements of success as I discovered them, my ideas, my schemes, all become yours through the **Grumiaux System**.

Year after year, the renewal business increases profits, and before you know it you have a substantial business of your own. Start by working a few hours evenings.

Full particulars by mentioning this magazine.

Books for Bee-keepers and Others.

Any of these books on which postage is not given will be forwarded by mail postpaid, on receipt of price. As many of the bee-books are sent with other goods by freight or express, incurring no postage, we give prices separately. You will notice that you can judge of the size of the books very well by the amount required for postage on each.

BIBLES, HYMN-BOOKS, AND OTHER GOOD BOOKS.

Postage.]	[Price without postage
8 Bible, good print, neatly bound	20
10 Bunyan's Pilgrim's Progress**	40
1 Gospel Hymns, consolidated, Nos. 1, 2, 3, and 4, words only; cloth.....	10
2 Same, board covers.....	20
3 New Testament in pretty flexible covers.....	05
<i>One-half off on all Gospel Hymns mentioned above.</i>	
5 New Testament, new version, paper covers.....	10

10 | New Testament, both Spanish and English... 25
In this book the Spanish is given in one column, and the English right opposite in another column. Every verse is opposite the corresponding one in the column adjoining, so that it affords the reader the very readiest means of comparing the language of the two. The writer has found this book to be a great help in the learning of Spanish, and he has also received spiritual benefit by getting a glimpse of the word of God in another language. The book is published by the American Bible Society, and we hope and trust it may have a good sale.

6 | Christian's Secret of a Happy Life. Cloth.... 25
For several years we have been unable to get a nice substantial copy of this book at a reasonable price. We are glad to tell our friends now, however, that we have a very pretty edition, bound in cloth, at the very reasonable price of 25 cents. If wanted by mail, add 6 cents for postage. This book has had a very large sale for more than 20 years, and when I tell you that quite a number of people have been converted to the Lord Jesus Christ simply by reading it you will no longer wonder why it sells. At one time it was carried and sold by the newsboys on our railways. It not only contains a wonderful "secret" for unbelievers, but for many who have been church-members all their lives, but not the "happy" church-members that God intended we should be.

BOOKS ESPECIALLY FOR BEE-KEEPERS.

MISCELLANEOUS HAND-BOOKS.

Postage.] [Price without postage.

5 | A B C of Carp Culture, by Geo. Finley..... 25
5 | A B C of Strawberry Culture,** by T. B. Terry.. New edition, revised and enlarged; paper, 45c; cloth, 68c; by mail, 75c.

5 | A B C of Potato Culture, Terry** New edition, revised & enlarged; paper, 45c; cloth, 68c, mail 75c. This is T. B. Terry's first and most masterly work.

6 | Asparagus Culture..... 40

6 | Alfalfa Culture..... 40

8 | Barn Plans and Out-buildings..... 90

2 | Celery for Profit, by T. Greiner**..... 25

The first really full and complete book on celery culture, at a moderate price, that we have had. It is full of pictures, and the whole thing is made so plain that a schoolboy ought to be able to grow paying crops at once without any assistance except from the book.

10 | Draining for Profit and Health, Warring..... 90

8 | Domestic Economy, by I. H. Mayer, M. D.**... 30

This book ought to save at least the money it costs, each year, in every household. It was written by a doctor, and one who has made the matter of domestic economy a life study. The regular price of the book is \$1.00, but by taking a large lot of them we are enabled to make the price only 30 cents.

10 | Fruit Harvesting, Storing, Marketing, etc..... 75

It has been well said that it is an easier matter to grow stuff than to sell it at a proper price after it is grown; and many men fail, not because they are inexperienced in getting a crop, but because they do not know how to sell their crops to the best advantage. This is the first book of the kind we have had as an aid in selling. It not only tells all about picking, sorting, and packing, but gives all the best methods for storing for one or two days or a longer time. It also tells about evaporating and canning when there is a glut in the market. It discusses fruit packages and commission dealers, and even takes in cold storage. It is a new book of 250 pages, full of illustrations. Publisher's price, \$1.00.

| Farming with Green Manures, postpaid**..... 90

This book was written several years ago; but since competent labor has got to be so expensive, and hard to get, many farmers are beginning to find they can turn under various green crops cheaper than to buy stable manure, and haul and spread it—cheaper, in fact, than they can buy fertilizers. This book mentions almost all plants used for plowing under, and gives the value compared with stable manure. Some of the claims seem extravagant, but we are at present getting good crops, and keeping up the fertility, by a similar treatment, on our ten-acre farm.

7 | Farm, Gardening, and Seed-growing**..... 90

10 | Fuller's Grape Culturist**..... 1 15

5 | Garden and Farm Topics, Henderson**..... 0

12 | Gardening for Pleasure, Henderson*..... 1 10

While "Gardening for Profit" is written with a view of making gardening pay, it touches a good deal on the pleasure part, and "Gardening for Pleasure" takes up this matter of beautifying your homes and improving your grounds, without the special point in view of making money out of it. I think most of you will need this if you get "Gardening for Profit." This work has 246 pages and 134 illustrations. (Retail price \$2.00.)

12 | Gardening for Profit**..... 1 10

This is a late revision of Peter Henderson's celebrated work. Nothing that has ever before been put in print has done so much toward making market-gardening a science and a fascinating industry. Peter Henderson stands at the head, without question, although we have many other books on these rural employments. If you can get but one book, let it be the above. It has 376 pages and 138 cuts. (Retail price \$2.00.)

8 | Gardening for Young and Old, Harris**..... 90

This is Joseph Harris' best and happiest effort. Although it goes over the same ground occupied by Peter Henderson, it particularly emphasizes thorough cultivation of the soil in preparing your ground; and this matter of adapting it to young people as well as old is brought out in a most happy vein. If your children have any sort of fancy for gardening it will pay you to make them a present of this book. It has 187 pages and 46 engravings.

3 | Grasses and Clovers, with Notes on Forage Plants..... 20

This is by Henry A. Dreer, author of the book "Vegetables Under Glass" that has had such a large sale of late. This little book tells how six tons of grass has been grown to the acre, and gives much other valuable matter.

Postage.] [Price without postage.

10 | Greenhouse Construction, by Prof. Taft**..... 1 15
This book is of recent publication, and is as full and complete in regard to the building of all glass structures as is the next book in regard to their management. Any one who builds even a small structure for plant-growing under glass will save the value of the book by reading it carefully.

12 | Greenhouse Management, by Prof. Taft**..... 1 15
This book is a companion to Greenhouse Construction. It is clear up to the times, contains 400 pages and a great lot of beautiful half-tone engravings. A large part of it is devoted to growing vegetables under glass, especially Grand Rapids lettuce, as well as fruits and flowers. The publisher's price is \$1.50; but as we bought quite a lot of them we can make a special price as above.

5 | Gregory on Cabbages, paper* 20
5 | Gregory on Squashes, paper*..... 20
5 | Gregory on Onions, paper*..... 20

The above three books, by our friend Gregory, are all valuable. The book on squashes especially is good reading for almost anybody, whether they raise squashes or not. It strikes at the very foundation of success in almost any kind of business.

5 | Handbook for Lumbermen..... 05
5 | Home Pork-making; 125 pages, illustrated..... 40

I think it will pay well for everybody who keeps a pig to have this book. It tells all about the care of the pig, with lots of pictures describing cheap pens, appliances, all about butchering, the latest and most approved short cuts; all about making the pickle, barreling the meat, fixing a smoke-house (from the cheapest barrel up to the most approved arrangement); all about pig-troughs; how to keep them clean with little labor; recipes for cooking pork in every imaginable way, etc. Publisher's price is 50 cents, ours as above.

15 | How to Make the Garden Pay**..... 1 35
By T. Greiner. Those who are interested in hot-beds, cold-frames, cold green-houses, hothouses, or glass structures of any kind for the growth of plants, can not afford to be without the book. Publisher's price \$2.00.

5 | How we Made the Old Farm Pay—A Fruit-book, Green 10

10 | Irrigation for the Farm, Garden, and Orchard* 85
By Stewart. This book, so far as I am informed, is almost the only work on this matter that is attracting so much interest, especially recently. Using water from springs, brooks, or windmills to take the place of rain, during our great drouths, is the great problem before us at the present day. The book has 274 pages and 142 cuts.

3 | Maple Sugar and the Sugar-bush**..... 25
5 | Manures; How to Make and How to Use
Them; in paper covers..... 30
6 | The same in cloth covers..... 65
Nut Culturist, postpaid..... 1 25

3 | Onions for Profit**..... 40
Fully up to the times, and includes both the old onion culture and the new method. The book is fully illustrated, and written with all the enthusiasm and even if one is not particularly interested in the business, almost any person who picks up Greiner's books will like to read them through.

10 | Our Farming, by T. B. Terry**..... 75
Same, paper cover, postpaid..... 50
In which he tells "how we have made a run-down farm bring both profit and pleasure."
If ordered by express or freight with other goods, 10c less.

8 | Practical Floriculture, Henderson.*..... 1 10
10 | Profits in Poultry.* 1 00

10 | Small-Fruit Culturist, Fuller 75

2 | Experiments in Farming. By Waldo F. Brown. 08
This little book ought to be worth its cost for what is said on each of the four different subjects; and the chapter on cement floors may be worth many dollars to anybody who has to use cement for floors, walks, or any thing else. In fact, if you follow the exceedingly plain directions you may save several dollars on one single job; and not only that, get a better cement floor than the average mason will make.

2 | Sweet Potatoes; Forty Years' Experience with.
By Waldo F. Brown*. 08
This little book, by a veteran teacher at our farm

Postage.]

[Price without postage.

ers' institutes, ought to be worth many times the price to everybody who grows even a few sweet potatoes in the garden. It also gives full particulars in regard to handling and keeping this potato, which is difficult to keep unless you know just how.

10 | Talks on Manures* 1 35
By Joseph Harris. Written in a conversational style, which makes it very interesting reading. It covers the subject very completely; contains numerous analyses of manures and comparative tables. The use of technical language is avoided, which makes the book of greatest value to the practical farmer. A book of 366 pages, nicely bound in cloth.

5 | The New Rhubarb Culture**..... 40
Whenever apples are worth a dollar a bushel or more, winter-grown rhubarb should pay big. It does not require an expensive house nor costly appliances. Any sort of cellar where it will not freeze is all right for it; and the small amount of heat necessary to force the rhubarb costs very little. The book is nicely bound in cloth, full of illustrations, mostly photos from real work, 130 pages. Every market-gardener should have this book, for the lessons taught indirectly, in regard to forcing other crops besides rhubarb. Publisher's price 50c.

5 | Tile Drainage, by W. I. Chamberlain..... 35
Fully illustrated, containing every thing of importance clear up to the present date.

The single chapter on digging ditches, with the illustrations given by Prof. Chamberlain, should alone make the book worth what it costs, to every one who has occasion to lay ten rods or more of tile. There is as much science in digging as in doing almost any thing else; and by following the plan directed in the book, one man will often do as much as two men without this knowledge.

5 | Tomato Culture 35
In three parts. Part first.—By J. W. Day, of Crystal Springs, Miss., treats of tomato culture in the South, with some remarks by A. I. Root, adapting it to the North. Part second.—By D. Cummins, of Conneaut, O., treats of tomato culture especially for canning-factories. Part third.—By A. I. Root, treats of plant-growing for market, and high-pressure gardening in general.

3 | Vegetables under Glass, by H. A. Dreer**..... 20
3 | Vegetables in the Open Air*..... 20

This is a sort of companion book to the one above. Both books are most fully illustrated, and are exceedingly valuable, especially at the very low price at which they are sold. The author, H. A. Dreer, has a greenhouse of his own that covers one solid acre, and he is pretty well conversant with all the arrangements and plans for protecting stuff from the weather, and afterward handling to the best advantage when the weather will permit out of doors.

3 | Winter Care of Horses and Cattle..... 25
This is friend Terry's second book in regard to farm matters; but it is so intimately connected with his potato-book that it reads almost like a sequel to it. If you have only a horse or a cow, I think it will pay you to invest in a book. It has 44 pages and 4 cuts.

3 | Wood's Common Objects for the Microscope**.. 47
8 | What to Do, and How to be Happy while Doing It 65

The above book, by A. I. Root, is a compilation of papers published in *Gleanings in Bee Culture*, in 1886, '7, and '8. It is intended to solve the problem of finding occupation for those scattered over our land out of employment. The suggestions are principally about finding employment about your own homes. The book is mainly upon market-gardening, fruit-culture, poultry-raising, etc. Illustrated, 188 pages, cloth.

8 | Same, paper covers..... 40

FREE LEAFLETS AND PAMPHLETS, IF YOU SEND POSTAGE STAMP.

Celery Growing by Sub-irrigation.
Cow Peas and Their Culture.
Crimson or Scarlet Clover.
Dwarf Essex Rape.
Lettuce Under Glass; full directions especially for growing Grand Rapids Lettuce.
Soy (or Soja) Bean; all about it.
Sweet Clover, and what it is good for.
Basswood Trees, growing for honey, lumber, etc.
Method of Treating Disease without Medicine.
Sanitary Drainage.

RAISING THE WIND, AND SOME STRAWS THAT SHOW ITS DIRECTION.

By the Bee Crank

When the crop of honey is coming into the hive very freely, it happens that there is not time for the surplus moisture to evaporate down to the consistency required by the little bee-chemists before sealing. At such times the bees have a way of supplementing the natural evaporation by forming a file extending from the entrance far back into the hive, and then by rapidly moving their wings set up a current of air that acts as an artificial ventilator and carries off the surplus moisture at a more rapid rate.

There are certain seasons of the year when orders for supplies do not come in to me as freely as at other times. My method of "raising the wind" to start something at such times is to allow a special discount on all cash orders. For December I will allow four per cent on all cash business received during that month. This allowance is well

worth your while, and it helps equalize my business and to keep things moving now, and relieve the conditions during the rush times of spring. Aside from the saving of money to you, think what it means to have your supplies ready and waiting for you when you want them.

At our last Indiana State Fair we were awarded five first premiums out of the possible eight: First on Bee-supplies; first on Beeswax; first on Comb Honey; first on Hoosier-Italian Bees; first on Carniolan Bees. All this with very spirited competition, and all exhibits very creditable. Our Hoosier-Italian bees were also awarded first premium at the Illinois State Fair. A catalog of these prize-winning goods free for the asking.

I am now paying 28 cents spot cash or 30 cents in trade for good average beeswax delivered here.

NO. 23

STRAY STRAWS

DR. C. C. MILLER

MR. EDITOR, I quite agree with what you say, p. 1366, about melting up combs where there is any question of foul brood. I am exceedingly thankful to say that, so far, I have no personal interest in foul brood. A few years ago it was within 12 miles of here, but I think it was not allowed to spread.

I THOUGHT I was somewhat ultra in having a space of 2 inches under bottom-bars. That's shallow compared with what John Silver has. He says, *Irish Bee Journal*, 63, "Nearly all my bottom-boards are of the reversible type, a flat floor one side, when turned upside down; this gives a three or four inch space below."

SOMETHING must be done to stop the man who edits the *Irish Bee Journal* from getting in his "digs" at every thing and everybody. Here's an item he publishes:

The *British Bee Journal* of Oct. 8 announced, for that date, a conversation of members of the B. B. K. A., at which one of the attractions would be "'Stings,' introduced by Colonel H. J. O. Walker."

And then what does that wild Irishman do but head the item, "The Human Sting"!

A NEWSPAPER statement was that the forest fires cost a million dollars a day. [The statement is possibly exaggerated, but nevertheless it is plain to any candid mind that millions of feet of valuable timber were burned, the loss of which can not do other than enhance the price of lumber in general, and, of course, all that is made from it, including hives. Probably this advance will not take place this year.—ED.]

A. I. ROOT, among your experiments with cereals you might try wheat *whole*. I used it by the peck in my college days as the cheapest fodder I could live on. I didn't grind it or do any thing with it except to boil it a long time. Then when cold there would be a sort of jelly between the grains. Take it with rich milk, and chew, chew, chew it, and it makes a very satisfying meal. [See Our Homes in this issue.—A. I. R.]

LEST BEGINNERS should think, upon reading page 1363, that either by the mouth or by the sting bees inject formic acid into the cell just before capping, I will say that authorities tell us that the acid gets into the honey through the circulation of the bee. [The reader is not to understand that we affirmed that the formic acid was introduced in the manner here explained, but only desired to show that the bulletin in question did not necessarily imply that it was introduced

through the sting, *a la* Clarke. That the formic acid gets into the honey through the process of inversion, or as some prefer to call it digestion, is probably true.—ED.]

"THEN YOU believe in the general principle of killing queens every two years, notwithstanding your 'exceptions that prove the rule,'" says ye editor, page 1364. Hardly that. Fact is, it isn't easy to tell what I do believe. Most emphatically I don't believe it would be wise for me to kill off all queens for no other reason than their being two years old. If I did that there would be no exceptional queens doing fine work in their old age, and they are just the ones I like to breed from, other things being equal. While I think Mr. Chapman's plan of requeening every year is good for him, I don't think my conditions favor it. In actual practice I let a queen live so long as she does good work. Not often do my bees allow a queen to live after that. I suspect the strain of bees may have a little to do with it.

BEESWAX WOOD POLISH.—The editor of GLEANINGS recommends beeswax and turpentine in a thin paste, page 1194. We think that he will find our recipe better for furniture polish, viz. —4 oz. each of beeswax, white wax, and Castile soap. Cut very fine and dissolve in three pints of boiling water. Then add 1½ pints of best turpentine. Rub on with one cloth; rub off with another; polish with a third. If found lumpy, stand the jar of polish in boiling water before using it.—*Irish Bee Journal*. ["White wax" is here mentioned as an ingredient. We do not know whether this refers to a bleached beeswax or to some of the mineral waxes. Our painter, who has tested paraffines and ceresines, says they have a tendency to make a greasy finish, while a pure beeswax and turpentine made into a paste makes a hard, smooth, and semi-glossy surface. We shall be glad to test this matter, and report, using paraffine for the white wax referred to.—ED.]

YEARS AGO I stood alone in advocating legislation that would give a bee-keeper legal control of a given territory. Indeed, I stood practically alone in advocating that a man had a moral right to his own territory. A distinct change of view as to the latter has taken place. Conventions have passed resolutions condemning intrusion upon another man's territory, and many are in accord with the views of the editor of the *Bee-keepers' Review*, who says, p. 339, "The man who will crowd in upon the territory of another should be looked upon as little better than a thief." It may be a long time, as he says, before a man can legally control a territory without owning the land also; but legal control is pretty sure to come. Granted that a man has a moral control, the

righteousness of legal control follows as day follows the night. If encroachment is in the nature of stealing, why should there not be a law against it just as against any other kind of stealing?

FOR FEAR there will be no one to say a word against a tariff on honey, I arise to remark that the danger from introducing foul brood with imported honey might be greater. Not many buy honey to feed, and the up-to-date bee-keeper would not think of feeding *any* honey unless he were sure as to its source. The only danger comes from some ignoramus who doesn't take a bee-journal, and he is likely to let his bees starve before buying honey to feed them. [We do not quite know whether you are for or against a tariff on honey; but we infer that you believe no good would arise from it. But foul brood, it should be remembered, is not transmitted necessarily through the feeding of infected honey, but from the fact that it may be on sale where the bees can get at it. If it is true that foul brood is spreading very rapidly throughout the United States, it may be wise to put a tariff on honey to prevent its importation from localities where there is foul brood.—ED.]

ONE OF THE THINGS I've wanted to know is how deep a space there can be under bottom-bars without having the bees build comb in it. John Silver says, *Irish Bee Journal*, 63, that he has a hive with a one-inch space under the frames, "and the bees keep the floor board of this hive as clean as a new pin. These frames have had an inch under for three years, and no comb is built underneath." If bees refrain from building in such a space, is it advisable to give them any thing less? [The danger of bees building comb under the bottom-bars when there is a space of more than $\frac{3}{8}$ inch, has been very greatly overestimated. It is agreed that, between the upper story and the lower story, there should not be more than $\frac{1}{16}$ inch. But between the bottom-bars and floor of the bottom-board the space can be anywhere from 1 to 3 inches—at least, various reports that have come in show that the bees will not build comb in this space except during an exceptionally heavy honey-flow. The building of such comb adds to one's supply of wax, and, what is quite important, causes the combs above the bars to be built clear down in contact with them. We have advocated for several years, as a happy medium between the extremes, a one-inch space under the frames; but we have always believed that two inches could be used to better advantage. We observe that the field bees in their return flight seem to like a large open space to fly into. When there is two inches under the frames, or even one inch, there will be a cluster of bees hanging down on which the fielders may alight. This affords the heavily loaded bees the finest kind of cushion against which to bump. Given their choice, the average bee will alight quicker on a bunch of bees than on a wooden alighting-board, no matter how favorable its slant. Mr. Vernon Burt and the editor made this a special point of observation some two years ago, when the bees were working heavily in the field. We lay prone on the ground and watched the fielders come in; and nine out of ten of them, where the entrance was from one to two inches deep, would fly clear through and alight on the other bees.—ED.]

J. J. WILDER, *American Bee Journal*, 338, has tested Caucasians for three years, the past season in seven or eight apiaries. They are great drone-rearers, bad at gathering glue near the close of the season, build too much burr and brace-comb, and the first cross with Italians is cross. But their good qualities overbalance their bad ones. They are superior gatherers, building up stronger than Italians in spring, at the same time being less inclined to swarm. [J. J. Wilder's experience is the same as ours, except Caucasians were inferior gatherers of honey, and very much more inclined to swarm. The general testimony has been that Caucasians and Carniolans alike swarm far more than Italians, and we therefore conclude that Mr. Wilder's experience on this point is rather unusual. We have had reports to the effect that Caucasians were the equal of Italians as honey-gatherers, and somewhat ahead. But the reason they failed so much at our yard was because they swarmed and swarmed and swarmed. This could have been held in check if a man had been kept on hand to watch. The fact that the Italians, in the *same yard*, with the same treatment and environment, did not swarm, would seem to show that for out-apiary work, especially Caucasians, for us, at least, would not be very desirable.]

We should be glad to get further reports, and in the mean time we wish to draw attention again to something to which all are agreed, that this black race runs excessively to the rearing of drones. This one fact would tend, wherever they are introduced, unless checked, to run out Italians in very short order. Should it subsequently develop that they are inferior to the yellow bee, the unhappy possessor of the Caucasians would be in a bad plight. The late J. B. Hall, of Canada, for example, found this out to his sorrow, and, as he said, it took years to run out the taint of this black race.—ED.]

EDITORIAL

By E. R. Root.

WHEN putting colonies in the cellar it would be a good time to unite any that may be weak.

A TRIP through the southern part of Ohio indicated that there has been a very severe drouth—much more severe, in fact, than in the regions immediately surrounding the big lakes. In some quarters there is a feeling that this drouth will affect the clover market for another season. As to this, see editorial elsewhere on this subject.

If you are desirous of moving your apiary a few rods, it is comparatively easy to do it during winter or the following spring. If the bees are wintered indoors, next spring set the hives out anywhere you please. If they are wintered outdoors, move the yard after the bees have been confined to the hives for a month or six weeks; but do the moving after it begins to warm up, and before the bees have had a flight.

UNCAPPING BY MACHINERY.

SCHEMES for uncapping combs are still receiving more or less attention. In the *American Bee Journal* for November is shown a machine that works on a principle somewhat similar to some described heretofore. But these machines have never gone beyond the experimental stage. Possibly the application of steam heat to the knives may go a long way toward solving the problem.

MILKING HONEY OUT OF EXTRACTING-SUPERS.

STRANGE as it may seem, a subscriber has a scheme for "milking" the honey out of a hive without the removal of a comb or uncapping the same; and, stranger still, he has actually sucked the honey out of several supers by means of a strong suction-pipe. We are not at liberty to give the details just now, but we expect to do so when the inventor has perfected his invention.

SHOULD DRONE COMB BE USED IN EXTRACTING-SUPERS IN PLACE OF WORKER?

IN the *American Bee Journal*, Mr. M. H. Reed, secretary of the Irish Bee-keepers' Association, is said to urge that, for extracting purposes, drone comb should be used, for the reason that honey will flow more readily from the larger than from the smaller cells during the operation of extracting, and for the further reason that "bees naturally draw out drone-cells more readily than worker-cells."

We should be glad to hear from some of our subscribers on this point. Unless perforated zinc is used, the queen would be quite sure to occupy this drone comb, and the result would be a lot of waste in the rearing of useless drones. This is a good theme for discussion, and we should be glad to hear from some of our subscribers.

IT PAYS TO MELT OLD COMBS.

ON p. 1366, last issue, we promised to give figures showing the results of rendering the very old combs mentioned. There were 225 combs, Langstroth size, and the total amount of wax secured was 69 pounds, which is a little over 3 pounds to each 10 combs. The total time of rendering was 9 hours. The combs were melted in two wash-boilers, and run through the press twice, yielding 63 lbs. of wax the first time, and 6 the second.

At 30 cts. per lb., 69 lbs. of wax will bring \$20.70. From this we must deduct the cost of the labor, \$1.80, leaving \$18.90.

Medium brood foundation, to fill 225 Langstroth frames, at 51 cts. per lb., amounts to about \$16.32, so that we get our full sheets of foundation for nothing, and have considerable left. The work could usually be done when the labor would not be worth 20 cts. an hour. But even if this is not possible, there is nothing lost.

ALEXANDER'S ARTICLES IN BOOK FORM.

WE have had so many requests of late to put Alexander's articles in book form that we are now arranging to publish a collection of his best papers. The little volume will be ready for distribution probably some time in January, and will be sold for 50 cts. In the mean time we shall be glad to club it with *GLEANINGS* one year

both for \$1.00. We will enter subscriptions immediately, and will send the book as soon as it is published.

The new volume will contain the cream of Mr. Alexander's writings; and when it is remembered that his career as a bee-keeper covered over forty years, and that during that time he managed hundreds of colonies in one yard, producing carloads of honey in a single season, his book should have a ready demand, especially when it is clubbed with the journal for \$1.00, for this is the only way in which it will be sold for the present. All arrears, if any, must be paid before advantage can be taken of this offer.

SPECIAL OFFERS ON RENEWALS.

AT this season of the year, many subscriptions for this journal will expire. Owing to the recent ruling of the Postoffice Department we are not permitted to send the journal but for a short time after the period for which the subscription has been paid; and we desire to remind those in arrears that, if they wish the journal without a break, it will be necessary to renew at once. In view of the fact that we can not continue the journal very long after the time paid for, we are making exceptionally low offers. If our friends will take advantage of them at once they will not miss a single issue. For example, we are making a special low offer on *GLEANINGS* one year, and Doolittle's 50-cent book, both for the price of the journal alone—\$1.00; but all subscriptions must be paid for one year in advance before advantage can be taken of this offer.

1908 CROP OF HONEY NOT AS LARGE AS FIRST REPORTED.

EVIDENCE is beginning to come that indicates that the crop of honey the past season, outside of the central-northern States, was not as large as earlier reports showed. One large buyer of honey is reporting that, in some sections at least, the crop is much lighter than it was last year, and that offers he has made have failed to secure honey. Another buyer went so far as to state that, even in the central-northern States, the crop was not as large as was first reported, as he finds some difficulty in getting all he requires for his trade.

Apparently our advice to sell honey around home has had some effect, as we have been informed that the local trade all over the country has been developed this year as it never was before. If, on top of this, the aggregate amount of honey in the United States was lighter than was reported early in the season, it is evident that prices ought now to stiffen. But it is now getting late, and comb honey, at least, ought to be disposed of before the general stagnation in price takes place that is apt to follow after the holidays. On the other hand, it may be advisable, in some cases at least, to hold over good extracted, awaiting a better market for another year.

WILL THE DROUTH THIS FALL AFFECT THE CLOVERS FOR NEXT SEASON?

ON page 1365, November 15, we quoted the editor of the *Review* as fearing that the long drouth had so far killed out the clovers that next year would be a light one for honey. Over

against this we introduced the testimony of a practical farmer of our acquaintance who was very certain that the drouth, at least in clay soils, had not affected the clovers. Since then we have had another talk with the same party, and he went on to explain his position in this wise: "Mr. Root, the clovers have roots that run down deep into the ground. If there is a good catch, and the roots get fully started, the clovers will stand a fall drouth very nicely. What kills the clovers is not drouth, but too much water in the ground, and hard freezing, resulting in what we farmers generally call *winter-killing*. It would take six weeks of hard rain to wet the ground so that a severe winter would do very much damage to the clovers, and I do not expect it now. If we get a reasonable amount of snow and rain between now and next spring, I predict that we shall see one of the biggest years for clover honey that we have had for years. Of course, I admit that the young clovers may be killed out by fall drouth—that is, before the roots have got very much of a hold. But you must remember, Mr. Root, that we have just had a splendid season for clover, and the roots of the last season's plants have been pretty well extended down into the soil. No, sir; I do not think the conditions this fall have been unfavorable, but quite to the contrary."

We have been taking pains to make inquiries among several farmers. One in particular, and a bee-keeper as well, we approached somewhat after this fashion:

"What do you think is going to be the effect of this drouth on clovers?"

Said he, "Why, it is not going to hurt them at all. I am looking for one hundred extra colonies that I should like to buy, because I am expecting a big year, and I want *more bees*."

"But suppose the clovers winter-kill?" we interposed.

"Of course, that is possible," said he, "but not probable under the conditions."

And then, without knowing the opinion of our other farmer friend, he went on to state that a dry soil is less likely to kill the clovers by reason of cold than a very wet one.

We have approached other farmers, with practically the same result. While they are located in Northern Ohio, they gave it as their opinion that a fall drouth is not necessarily hurtful to clover.

Whether a sandy soil during a period of fall drouth would be more hurtful than a clay soil on clovers, we can not say; but we should be inclined to think that way. If so, this would go to confirm, in part, the fears of Mr. Hutchinson, whose bees are all located on a sandy soil.

We should be pleased to get reports from all over the country, as this is a vital and important question. It is possible and even probable that locality has very much to do with it; but as most bee-keepers are located on a clay soil, we hope the outlook may be more favorable than the editor of the *Review* has feared.

HAS THE SAN FRANCISCO HONEY MARKET BEEN QUOTED TOO HIGH?

In the *American Bee Journal* for November, p. 327, is a letter to editor York, which we here reproduce:

Editor York:—In the *American Bee Journal* for October, on the first editorial page, is a comment entitled, "The Honey Market Unusual," wherein it is claimed that comb honey stands firmly in San Francisco at 17 cents. By the way, I see GLEANINGS makes the same claim.

Now, the above quotation is very far from the truth, in proof of which I enclose two letters, one from a commission firm in Sacramento, and the other from a bee-keeper in Nevada. Note the commission man informs me that Mono County and Nevada have had big crops of honey. Well, I know that Mono County had less than 400 cases of comb honey; and Mr. J. W. Carter, of Nevada, informed me in September that this was the poorest honey season he had known in his bee-keeping experience of 17 years. So far as my own experience goes, this is my first season in this part of the country.

H. CHRISTENSEN.

Coleville, Mono Co., Cal., Oct. 26.

We do not see any thing in this letter that really *proves* that the market has been quoted too high. While it is true that Mr. Christensen introduced the name of a commission firm as authority for the statement that there is a large supply of honey in Nevada and in Mono and Inyo counties, Cal., it is proper to remark that some commission firms biased by selfish interests make statements going to show that there are large supplies in sight when there are not.

Then Mr. C. introduces another statement, to the effect that a Nevada bee-keeper says all he can get is 9½ for the first grade of comb, and 8½ for the second, as tending to show that our quotations run too high. Over against these two statements Mr. Christensen states *on his own positive knowledge* that Mono Co. had less than 400 cases of comb honey, and that J. W. Carter, of Nevada, informed him that this was the poorest honey season he had known in a bee-keeping experience of 17 years. We can not understand why Mr. Christensen should discredit his own knowledge by introducing a claim from a party who may have an "ax to grind." Then it would seem to us that the statement from Mr. Carter ought to have as much weight as that of the other bee-keeper who said he could not get more than 9½ cents for the reason that the supply was large.

It is a rather significant fact in this connection that prices on California sage honey are relatively high in Liverpool, England. If there is so much honey available as the commission man in question would have us believe, why is it quoted high in Liverpool? and why does he not make a "big scoop" by buying up all the honey in sight and shipping it to England?

Another significant fact worthy of note is that the market in New York seems to be rather bare of California sage honey of any kind, and prices there are pretty well up. If there was an oversupply at Sacramento, or even San Francisco, it would naturally gravitate to the Eastern markets as it always has done. But the fact is, California honey in the East is not very much in evidence this season.

Our quotations for San Francisco were furnished us by the *Pacific Rural Press*—a journal which has no interest in quoting the market either high or low. We have heretofore found their quotations quite reliable; and with all the evidence in hand we are yet to be convinced, even on Mr. Christensen's letter, that the San Francisco market is quoted too high.

We shall be glad to hear from local bee-keepers in and about San Francisco, or, in fact, from all over California, for that matter. While we admit that we desire to keep prices up, we do not wish to do so if the facts do not warrant it.

CONVERSATIONS WITH DOOLITTLE

SOME QUESTIONS ANSWERED.

A correspondent asks me if I will answer some questions through *GLEANINGS*. He says he is a novice in bee-keeping, and wishes me to simplify my answers so that even a novice can understand, taking it for granted that *GLEANINGS* has many readers who are little if any further advanced than he is. I think it best to answer his questions by number rather than in the usual conversational style.

1. I have been thinking of putting my 32 colonies all together for wintering, setting the hives so close together that the hives will all touch one another except the entrance part, which will face outward, packing underneath, on top and around the whole with chaff or old carpet, so that the heat of the whole will keep all warm and at an even temperature. What do you think of the plan?

Answer.—My fear would be that, during some warm spell in winter, they would become too warm, go to breeding, and eventually die of diarrhea and exhausted vitality. Some years ago one of our leading apiarists took fifty colonies out of their original hives and placed them in boxes made to contain four frames of sealed honey. On either side of these boxes wire cloth was nailed, and the whole fifty placed in one large box, which box was set on a car and run into his underground bee-cellar. The idea was the same as yours, that each would help maintain a mutual warmth for the whole, and thus save honey and promote good wintering. After all were in the box, old carpeting to the depth of four or five inches was placed over them, and they were left undisturbed for four or five weeks. The normal temperature inside of the cluster of bees during winter, when they are in really good condition, is from sixty to seventy degrees. At the end of five weeks the temperature inside the box was found to be above 90°, with the bees all in commotion, trying to get out to escape such a degree of heat. The car was run out the first mild day thereafter, and thousands of bees came out and died. The result was that two-thirds of the colonies were dead before the first of March, while on April 15 not one of the fifty colonies was living. This would go against your proposed experiment; but if you so desired you could try eight or ten colonies, as they might do better this way outdoors than in the cellar. It is always well, when trying new experiments, to use only a small part of our stock for the trial, and thus not make a serious failure by putting all our eggs in one basket.

2. Is early pollen necessary to successful bee-keeping?

Answer.—From my point of view I should say yes. The first pollen in spring in this locality comes from skunk-cabbage, followed by pussy willow, soft maple, and elm. This pollen stimulates the bees to brood-rearing and great activity, upon which much of the profit of the season depends. The next source of pollen comes from the hard maple, this coming into bloom a few days before the fruit-trees. This source gives an abundant yield of pollen; but I have noticed

many times that, where the first mentioned are killed by frosts, the bees are not in nearly as good shape at time of fruit-blooming, no matter how favorable the weather between blooms may be, as is the case where any one or all of the four first named give the bees a chance to store from them. In selecting a location a person should know that some one of the early-pollen producers are present if they are to expect the best possible success. Artificial pollen, such as rye or oat meal, can be substituted, but none of them can ever take the place of natural pollen as a stimulant for bees. In years when the early pollen was killed by frost I have fed the bees meal; and, while it was a pretty sight to see thousands of bees at work in the meal, and hovering over it while it was being packed in the pollen-baskets, yet a much smaller amount of brood would be reared under precisely the same weather conditions than when the bees had access to natural pollen.

3. The past summer I saw a bee dragging out a dead drone, and when she came to the edge of the alighting-board she flew some ten or twelve feet, carrying the dead drone with her. Does this not show that a bee has strength greater in proportion than man?

Answer.—Yes. Bees have a most marvelous power when that power is compared with man or even a horse. If the apiarist had even half the strength in proportion to that which the bee has, none of us would complain about lifting heavy hives, or be experimenting with hive-lifting devices. But, after all, man is much superior to the bee in that he brings and makes all the forces of nature subject to him.

4. I wish you would tell the readers of *GLEANINGS* how to avoid being stung. A man who once met you at a convention said you told him that you did not now receive one sting to where you did twenty when you first commenced to keep bees. Is it the kind of bees you keep?

Answer.—Bees are cross sometimes, and cross bees often sting. Some classes of stings are unavoidable. A bee may become so infuriated as to strike without warning, and sting as it strikes. However, bees must be badly provoked to do this, and *never* do so except as the object of their disturbance is near their hive or home. The novice in apiculture is generally quite inclined to think bees are roaming around, bent only on stinging every thing far and near. This is not so, for a bee seldom ventures an attack ten rods from its hive, and very seldom then unless its hive has been molested. Besides the unavoidable class of stings caused as above, the novice, by his way of provoking the bee, is apt to get many more. If a bee having an inquiring mind comes looking around the face or hands of such a person, the first thing he does is to begin striking at it, which only tends to irritate the bee. Every move makes the matter worse. Shrieking, beating the air, and tearing insanely about, as very many are apt to do, are only so many steps leading to a melancholy and almost certain result. When such a bee comes near, instead of doing as above, gently incline the rim of the hat toward it; and if it still persists in buzzing about the head, put the hands or arms up before the face and walk quietly away from near the hive, when the bee will soon leave you. If several attack

you, use this same way; and as soon as you are a little way from the hive, put your head (protected by the arms at the face) in some leafy bushes which may be near by. Or in the absence of the bushes, go prone, face down, on the ground, when in a few minutes all the bees will leave you, and you can walk quietly away. Of course, when you are at work with the bees it is best to wear a veil, which is all the protection you need if you are careful with your work with the hives. Be careful about jarring the hive before you tell the bees you are there by giving them a puff or two of smoke at the entrance, and, above all, avoid the killing of bees, as the poisonous smell that fills the air where bees are crushed is one of the quickest ways to irritate them.

NOTES FROM CANADA

By R. F. HOLTERMANN.

ROBBING.

I found by accident that, for covering supers of honey in the apiary at robbing time, the best material is a felt cloth loosely put together. The bees appear to be afraid to alight on it. I suppose it looks to them about as inviting as a loose brush-heap looks to a man for strolling through.

FINDING QUEENS IN POPULOUS STOCKS.

At the last Norfolk County Bee-keepers' convention held recently at Simcoe, F. J. Miller, President of the Ontario Bee-keepers' Association, gave his method of finding a queen in a populous colony, mentioning the method specially in connection with finding queens for clipping. He instructed the bee-keepers to give the colony a fairly sharp smoke at the entrance of the hive. The bees will roar, and the sound is to be noted. In about 2½ minutes the bees should be given a few more sharp puffs at the entrance so they will again roar. The moment the roar changes from the sharp to the lower note, the queen, in a hive not deeper than the Langstroth, will be found in the bee-space below the cover. Mr. Miller stated that the colony must be strong if this method is to be a success, but that such colonies were the very ones in which it is difficult to find the queen.

REQUEENING.

I made the statement at the same convention that there is less need for bee-keepers to requeen the colonies where there is a fall flow. The bees, in a locality having a fall flow, are much more apt to supersede defective or failing queens themselves during this flow. The first time I saw an apiary during a good buckwheat flow was when visiting Mr. C. W. Post. He at that time showed me in one apiary eight colonies in which mother and daughter were laying in the same hive.

BASSWOOD POLLEN.

Some time ago a highly valued friend and well-known contributor to GLEANINGS made the statement that basswood has no pollen. I tried to

point out that, according to nature's laws, this would be impossible. The United States Department of Agriculture has issued a Bulletin (No. 110) which Dr. Wiley has been kind enough to send to me. This includes "A Microscopical Study of Honey Pollen," by W. J. Young, assistant, Microchemical Laboratory. On page 79 (Fig. 6) we find illustrated the pollen grains of basswood. This surely settles the matter. It might be instructive for GLEANINGS to reproduce illustrations of some of the pollens in which bee-keepers are most interested.

STOPPING UP LEAKS IN HIVES.

When moving bees I always carry about me an assortment of nails, crate-staples, and a hammer. I formerly had convenient strips of wood to stop up leaks; but for over a year I have used for this last purpose cotton-batting. For this purpose it is superior to anything else I ever used. In a moment it can be broken into any size; it can be made to fit any opening; it sticks well where put, and it is so loose in texture that the bees prefer to leave it alone. I also have the smoker going, especially in the early part of the trip. I am giving this information because the idea has been of value to me. Some readers of GLEANINGS think I have a lot of rough uneven hives; but this is not the case. Accidents will happen in the best-regulated houses, and it is well to be prepared for them.

TURNING LOSSES INTO PROFIT.

W. S. Manley, at the National convention at Detroit, stated that it seemed to be a rather difficult matter to turn losses into profit; but that a loss can be turned into profit whenever one has to go through an experience in which the first loss prevents him from making the same mistake again. Friend Manley lost his bees, and his neighbors lost theirs because the stores gathered in the fall were not good. Of course, he wisely decided that there was no use in losing the wax and combs as well as the bees, and he therefore melted them up for wax. However, he concluded that this was a rather expensive way of getting wax, and he now feeds sugar syrup to the bees for winter stores. He either has combs filled earlier with sugar syrup, and shakes the bees upon them after the frost has stopped the honey-flow, or he shakes the bees upon empty combs, and in an empty super or body underneath he puts an open feeder with warm syrup. Even in pretty cold weather the bees, feeling the heat from the warm feeder underneath, will store the syrup for winter.

This fall I fed syrup made by stirring 2½ parts by measure of sugar into one of boiling water, adding a teaspoonful of tartaric acid to every 13 lbs. of sugar. Such sugar does not require much evaporation; and if the brood-chamber is contracted so the bees will cover their combs and stores they will be in the very best condition for winter.

Of course, we should all have an ideal. Circumstances, such as lack of time, may prevent us from doing what we know to be best. All we can do is to aim at the ideal we have set before us.

GLEANINGS FROM OUR EXCHANGES

By W. K. MORRISON

THE CONSUMPTION OF BEESWAX IN FRANCE.

According to the *Revue Eclectique d'Apiculture*, of Paris, there is a large production and consumption of beeswax in France. In round numbers the annual production is about 2,000,000 kilos, or 4,400,000 lbs. The importation is over 250,000 kilos, or 550,000 lbs. The imports are contributed by Spain, Dominican Republic, Turkey, Low Countries, Japan, Haiti, Cuba, Madagascar, Algeria, Tunis, Morocco, French Indo-China, French Protectorates, and various foreign countries. The maximum tariff is \$2.40 on 220 lbs., and the minimum \$1.60 per 220 lbs., or less than one cent a pound on the average.

MORE ADULTERATION.

Not long ago the national pure-food inspectors seized 1656 cans of adulterated molasses at Memphis, Tenn. It was marked "Early Bird Brand Sugar House Molasses," put up for W. C. Early & Co., Memphis, Tenn. On analysis by the Bureau of Chemistry it was found to be nearly 50 per cent glucose, and therefore misbranded. An action was commenced in the western district United States Court for Tennessee; but the defendants decided to waive a trial, and allowed the goods confiscated by the Department of Agriculture. A curious feature of this case is that Early & Co. could have escaped the law by labeling their syrup "corn syrup," though it is composed of equal parts of molasses and glucose, and never saw "corn." If bee-keepers will look around the grocery stores in their neighborhood they will probably discover more cases of this kind. Of all offenders against the law, glucose is probably the worst. A kindly warning would put the grocer on his guard.

THE TARIFF ON HONEY AND BEESWAX.

The tariff is a two-edged sword—it cuts both ways. We now have a tariff on honey coming into this country, yet the price is lower in the United States than it is in England, which has no tariff. France also has a tariff, and the price is lower than it is in England. Beeswax is higher in price all over Europe than it is here. In England I should say the price (on an average), judging by the market quotations, is about 5 cents higher than here. Why is this so? I think it is due to the higher esteem in which these products are held on the other side of the herring-pond.

Large amounts of paraffine, ozokerite, Japan wax, and other substitutes for real beeswax, are used in this country, and this has a tendency to make lower prices. It therefore strikes me very forcibly that no tariff on beeswax will be effective unless there is an equal or greater duty on substitutes for beeswax. Personally I should like to see a heavy duty levied on these substitutes. In most instances they are used to keep the price of beeswax down. Let us not launch a boomerang by asking for a tariff before the substitutes are dealt with.

THE PURE-FOOD LAW.

Dr. Wiley recently stated to the Sphinx Club, of New York, that obtaining purchasers for adulterated food came within the purview of the officers charged with the enforcement of the pure-food law. It is presumed the matter of misleading advertisements will be taken into consideration in making out a case against a violator of the law. This will to some extent prevent quibbling about the label. For example, some dealers in groceries still advertise "California Honey Drips," conveying the impression to the unsophisticated buyer that he is buying strained honey from California, when, as a matter of fact, it is neither more nor less than our old enemy glucose masquerading under another name. It is to be hoped every reader who sees this will call the attention of the pure-food authorities to all violations of this nature that in any way affect the honey business. A little missionary work of this kind will help up the price of honey all over this broad land. The word "honey" is the property of bee-keepers and no others.

A CONTESTED DECISION.

They have legal squabbles in France as well as in this country over runaway swarms. In the August issue of *L'Apiculteur* a Miss Brunet criticises the opinion rendered by a justice of the peace in the third canton of Brest. However, in the November issue the editor, after a careful study of the case, comes to the conclusion that the judge was peculiarly fit for his work, and his verdict unattackable. Briefly this was his decision:

1. To maintain his property rights the owner of a swarm must pursue it very closely if it leaves.
2. The rightful claimant is the one who saves it.

Most Americans will agree that this is good sense if not good law. This seems to be the essence of the judge's opinion, who took the law of 1889 as his guide in the matter. The editor thinks it would be a good thing to have the opinion of the Court of Cassation on a case of this kind. The latter is similar to our Court of Appeals or the Supreme Court.

THE VALUE OF CERTAIN FOODS.

Some wonder why honey prices are higher in Europe than in America. The reason is not far to seek. The inhabitants of nearly all European countries value honey higher than we do, and are, consequently, willing to pay better prices. Fine grades are strongly competed for, especially by the well-to-do and rich. It is not so in this country to the same degree. One seldom sees honey on the tables of the best hotels and restaurants in the great cities, even when the proprietors send to Europe for all kinds of dainties. Some foods are overestimated. Oysters are thought by many to be very nourishing, when, as a matter of fact, they are poor in nutrition. Eggs are often overestimated. Cheese is usually underestimated. Milk is underestimated by most people in America, and Europe too. Meat extracts may not be nutritious, though many persons think these things must be extremely valuable as food. Honey has the merit of being very

nourishing, and at the same time very palatable, causing it to be well received by the digestive system. It is not spoiled in cooking as many good foods are.

SWEET CLOVER COMPARED WITH OTHER CLOVERS FOR FEEDING STOCK.

That great journal, *Hoard's Dairyman*, of Ft. Atkinson, Wis., in its issue for Nov. 13, contains a striking editorial on sweet clover. Briefly, it is a *resume* of what had formerly appeared in that journal by Prof. Ira M. Buell, of Beloit College, Wisconsin.

The editors say there is a close connection between clover, alfalfa, and sweet clover, not only botanically but chemically, as an analysis taken from the "International Encyclopædia" will show. Here it is:

	In the green growth.		
	CLOVER.	SWEET CLOVER.	ALFALFA.
Water	70.8	76.5	71.8
Protein	4.4	2.8	4.8
Fat	1.1	0.4	1.0
Nitrogen, free extract	13.06	12.1	12.8
Crude fiber	8.1	6.6	1.4
Ash	2.1	1.6	2.7
	In the dried state.		
	CLOVER.	SWEET CLOVER.	ALFALFA.
Protein	14.9	12.0	13.7
Fat	3.8	1.7	3.6
Nitrogen, free extract	44.3	51.4	46.2
Crude fiber	27.1	28.9	26.7
Ash	7.1	6.8	9.7

In these tables the sweet clover comes off as slightly better than either clover or alfalfa as to food value. As a matter of fact, its rank taste is largely due to an excess of nitrogen as compared with its fat and ash content.

RELISHED BY STOCK.

Hoard's Dairyman is fair, however, and says that the young growth is quite palatable, and resembles asparagus. The taste depends largely on condition and seasonableness; that is to say, it must be cut at the proper season—a rule which applies to other crops as well. It also says, however, that sweet clover is somewhat repellent at first, especially to cows, but is usually easily overcome, so that it is greatly relished. Horses are said to be especially fond of it.

ITS DISTRIBUTION AND HISTORY.

As to its distribution and history, the *Dairyman's* knowledge is very full. Its native home is Central Asia, so that its cradle is the same as that of the human race. Homer, the great poet, noted it growing on the plains of Greece and Asia Minor, and he tells us that the horses of the Greeks were fed on it at the siege of Troy. It is said to be still raised in the East, being grown in the same manner as alfalfa—by irrigation—and used for the same purposes. The name, "melilotus," means "honey-blossom," and is common to both the Latin and Greek languages. Pliny wrote very accurate accounts of it, telling of its uses and distribution, and gave a more extended description of it than most of our botanists. In his day it was highly esteemed as a honey-plant and as a medicine, and even now it is highly valued as such by Europeans.

OTHER SPECIES.

Other species of melilot are also prized in Central and Southern Europe. In Switzerland the fine flavor of the dairy products is largely due to the presence of sweet clover in their pastures.

Long ago Asa Gray showed that, in its new home, sweet clover showed a striking increase in strength and vigor. This shows its adaptability to new conditions.

As regards its use as a fertilizer, the editor closes with this significant paragraph:

The use of the bacteria-supporting legumes for the maintenance of the fertility of our farms is one of the most promising fields for agricultural experiment. It is well to know that we have right at our own doors the most hardy, rank-growing members of this class, and one that promises the largest increment of fertilizing matter from its growth.

Now where are the people who say sweet clover is a *weed*?

BEE-KEEPING AMONG THE ROCKIES.

By WESLEY FOSTER.

Mr. Scholl, you say in the Oct. 15th issue that comb honey goes at double-first-class freight rate. Comb honey takes the first-class rate when the glass is protected. Tack a separator over the glass.

LOCATING AN APIARY.

A dry knoll covered with buffalo grass, and above irrigating-ditches, is my favorite choice for a bee-yard. There are no weeds to cut, nor is there any danger of being drowned out by some careless irrigator. The swarms usually alight on one of the fence-posts, and are quickly seen. There is one serious objection to a knoll; it gets all the wind, and we have *wind* out here in the winter. When the farmers burn the grass along the ditches the fire often gets away from them, but there is little danger if the apiary is on a buffalo-grass plot, for there isn't enough grass to set a hive on fire, ordinarily.

RETAIL PRICES OF HONEY IN COLORADO, ESPECIALLY DENVER.

No. 1 white comb honey retails at 20 cts. per section, or 2 for 35 cts.; No. 2 and poorly graded goods bring 15 cts. Some cull honey sells at 12½. Extracted honey in glasses holding from 5 to 8 oz. sells at 10 cts.; ½-pint jars bring 15 to 20; pint jars retail at 25 to 30. There is considerable honey in 1-lb. jars (some with a piece of comb inserted in the honey), selling at 25. Seven or eight carloads of comb and extracted have been brought into Denver, and I think the market here is very well supplied.

COLORADO STATE BEE CONVENTION.

The Colorado State Bee-keepers' Association is to hold a convention, "a round-up," and a lot of new honey-money-making ideas are to be roped, tied, branded, and taken home to be put into practical operation by any who can fall into the fellowship feeling of a round-up, and can tell a young unbroken well-bred bee idea when they see one. We will meet at the American House, Denver, Dec. 8, 9. This convention will not be quite as long as usual, but there will be less chance for good ideas to take to tall timber between sessions. All are asked to send in

questions on which light is wanted; and, as one of the program committee, I will try to find some "live wire" bee-man to furnish the power.

LECTURES AT FARMERS' INSTITUTES.

Pres. Collins, of the State Association, has been engaged to lecture before the Farmers' Institutes conducted throughout the State by the Agricultural College located at Fort Collins. Mr. Collins' subject is "Bee-keeping for Profit." He will do a great deal to raise the standard of bee culture in the State and the West. The bee-keepers certainly appreciate the work the College is doing for their benefit; and Prof. Gillette, who initiated the work, is to be thanked for his interest along this line. Mr. Collins is well fitted for the work. He is a forceful public speaker, arousing interest quickly, and he has made a success of bee culture.

COMB-HONEY GRADING, EASTERN AND WESTERN.

I agree with the editor that the illustration of comb-honey grading on page 1316 is interesting. Now, according to the rules adopted by the Colorado State Bee-keepers' Association last year, the top case and section would be in the No. 1 grades, either white or light amber. The middle section is not evenly capped. The unevenness was likely caused by a lull in the honey-flow while the section was being filled. This unevenness would place the middle case in the No. 2 grade. I have not mentioned weight here, for I can not tell weight from a picture. The lower section is not sufficiently capped to be put in any grade, and would be called cull honey. There are over one hundred uncapped cells on the visible side of this section, exclusive of the outside row. I infer that the sections represent the contents of each case beside which they stand.

CROWDING BEES TO SECURE ENTIRE CAPPING OF SECTION HONEY.

I would not say it is practicable, that it pays, or that it is very necessary to crowd the bees to secure better capping of honey. Tiering up supers, if understood, will result in much of the honey being capped as is the top case in the illustration on page 1316, Nov. 1.

The editor says the tendency is to boost the gradings, putting them a little higher than they deserve. Conscientiously following the rules, and when in doubt putting the doubtful section in the lower grade, will start the tendency toward the other and better way.

DROUTH INCREASING THE FLOW OF NECTAR.

I notice occasional reports of short crops on account of drouth. The season of 1908 is the driest I have ever known, and yet I averaged 133 4x5 sections to the colony, which is the best yield I ever had. At the beginning of the season I had given up all hope of much surplus; but as the weather continued dry the bees kept working until the aster and goldenrod ceased to blossom. I can't see that the drouth had any effect except to increase the flow.

Ashtabula, O.

THOMAS CLARK.

GENERAL CORRESPONDENCE

WHAT HIVE TO ADOPT.

A Discussion of the Merits of Different-Sized Hives, Taking into Consideration the Man, the Methods, and the Locality.

BY E. D. TOWNSEND.

Continued from last issue, page 1372.

The size of a hive is much more important than the shape. A well-shaped hive is important only because it is more convenient for the apiarist. In outyards every hive should be the same, for a variety of sizes and shapes is an abomination. I have had experience with different sizes; but every one of my extracted-honey colonies is now in a ten-frame factory-made Dovetailed hive, and every super is the same as the lower story or body, so that all are interchangeable. I use ten Hoffman frames in the bodies, and eight loose hanging frames in the upper stories, the eight frames in the ten-frame super making $1\frac{3}{4}$ -inch spacing, so that all combs are bulged.

Mr. J. N. Harris, of St. Louis, Mich., has two or three outyards in the northern part of the State. A part of the colonies are in eight-frame hives, and the rest in twelve-frame, these twelve-frame hives being the only ones I know of in the locality. Mr. Harris is an old veteran at the business, and he is very thorough in his work with his bees. For instance, every comb that he has is built from wired foundation; and if it happens there are too many drone-cells in any one comb, that comb is replaced with a full sheet of worker foundation. Now, if he goes to this trouble to keep his combs in good condition, it is evident that all the other work around the bees must be done in the same thorough manner. Since he winters the eight and twelve frame colonies in the same cellar, and manages them through the season as nearly alike as possible, Mr. Harris is in position to tell which hive is the best to adopt with his system of management in his locality, especially as he has only one object in view—the securing of the most extracted honey with the least expenditure of labor and expense.

Mr. Harris says that colonies in the twelve-frame hives go into winter quarters with more bees than those in the eight-frame hives, and also that they come out much stronger in the spring. He has found that he can count on having about eight combs of brood in the twelve-frame hives, and only six in the eight-frame; so that the twelve-frame colonies have about 25 percent more brood than the eight-frame. I wish Mr. Harris could have tested the ten-frame hive in connection with the eight and twelve frame, for it would seem to me that if he got 25 percent more brood in the twelve-frame colonies than in the eight-frame, then the ten-frame hive with the same management should give him only one comb of brood less than the twelve-frame, and one more than the eight-frame. The best point in favor of the twelve-frame hive is that it is so large that he does not need to do so much "fussing" with them as with those in the smaller hive, and he is

able to attend to more colonies, getting more honey per colony. He keeps all the colonies he can attend to himself, instead of depending on any help to care for a larger number. Mr. Harris has used fifteen and sixteen frame hives; but he could not see that they offered any advantage over the twelve-frame size, while they had many disadvantages.

Twenty-four combs filled with honey and brood will cost the same, whether coming from two twelve-frame hives or from three eight-frame hives; and there is not very much difference between the cost of the two twelve-frame hives and the three eight-frame hives. Mr. Harris says that he secures the same amount of surplus honey from three eight-frame colonies, which, at a given time previous to the honey-flow, have five combs of brood each, that he secures from two twelve-frame colonies each having eight combs of brood at the same time before the honey-flow. Now, as he has said that he can produce six combs of brood in the eight-frame hive to eight in the twelve-frame hive, it will be seen that the eight-frame hive is still ahead, taking into consideration the number of frames in the hive. In other words, it would take fewer bees to gather the honey in a given locality in the eight-frame hive than in a twelve-frame. If I were selling bees I would ask about the same money for 60 or 65 colonies in twelve-frame hives that I would for 90 colonies in eight-frame hives; and the surplus-receptacles for each lot would probably sell for about the same.

The Langstroth frame being the standard, I think that eight Langstroth frames make a small hive; twelve make a large hive, and ten a medium one. Other things being equal, a two-frame nucleus in proportion to the number of combs it contains will store just as much honey as a colony in an eight-frame hive, and considerably more honey than a colony in a ten-frame hive, and, of course, much more yet than a colony in a twelve-frame hive. This comparison is based on the ability of the queen to keep the different sizes of hives stocked with eggs, and on the disposition of the workers to take care of the eggs and brood afterward. An ordinary queen will fill a ten-frame hive with brood; but it is rare that a queen will use all of the room in a twelve-frame hive. Bees on ten frames of brood will store the same amount of honey whether the brood is all in one hive or divided into two parts and in two hives. It will be seen by this that the number of combs of brood and bees we have at the beginning of the surplus-honey flow determines the amount of honey that will be brought in, regardless of the size of the hive. Generally speaking, the smaller the hive the more honey will be placed in the super.

After satisfying myself that the eight-frame hive was large enough for the average queen, I made up my mind to use the ten-frame hive, the two additional frames being principally for honey. Although these two extra frames may contain brood in some cases, they were usually filled with honey and comb—a reserve fund, so to speak; and with this reserve on hand our colonies will not have to be watched as closely in regard to stores, and are thus better equipped for out-ward service, where they may be left by themselves at quite long intervals at times.

It is possible for the expert honey-producer to make a fair success with almost any size or shape of hive, and in almost any location; but it is very convenient to have the hive conform to the system that is best for the special location.

Remus, Mich.

THE ARGENTINE ANT.

A Possible Pest of the Apiary.

BY RALPH BENTON.

Assistant Entomologist, University of California.

What we have to say in regard to the Argentine ant as a possible pest of the apiary is necessarily somewhat in the nature of a conjecture, since we have not yet been able to locate within the infested areas of the State any apiaries of commercial size upon which to make observations. There are upon record, so far as we know, no extended observations upon the effects of the inroads of this pest in Louisiana and Mississippi upon the bee-keeping industry of that region. Knowing of his interest in bee-keeping matters, we have written to Professor Newell upon this subject, but have not yet heard from him in reply.*

Meanwhile we have had under observation for several weeks past in the infested area in East Oakland two small apiaries, both of them not far from the seat of the University investigations, the Oakland formicary. The first of these apiaries consists simply of two colonies of bees in frame hives located in a vacant lot, and placed some two feet off the ground on a bench. There are at the present time no traces of ants in or about the hives, and the only clue that we have that ants have troubled them is that one of the colonies is quite weak, coupled with the fact that the legs of the bench have been placed at some time in cans filled with water or oil. The second apiary consists of some half-dozen hives ranged out on a bench some 18 inches off the ground beneath several spreading and low-hanging lemon-trees. Upon examining the citrus trees it was found that they were well infested with yellow scale, and that myriads of Argentine ants were passing to and fro upon the trunks and limbs of the trees. The apple-trees in the immediate vicinity were also examined with similar results—myriads of ants colonizing and caring for an extended infestation of woolly aphids.

On approaching the colonies of bees, and examining them more closely, we found numbers of ants busily going and coming, as is usual with

*Since the preparation of this paper, Professor Newell has been heard from. He writes that he has not had any experience with the pest in question in large commercial apiaries; but further that, to his knowledge, several parties keeping bees in a small way in New Orleans have entirely given it up, finding it impracticable to protect the bees successfully from the ants. His own personal experience is significant, of which he writes as follows: "I have six colonies of bees here at Baton Rouge, and have had occasion to notice the vigorous manner in which the ants attack the larvae in the hives and carry away the stored honey. Thus far I have protected the colonies by placing each colony upon a stand having four legs, each leg being placed in a dish of water. This water has to be renewed every few days unless there are continuous rains, for the ants will cross it as soon as any scum or dust film appears upon its surface." This experience of Professor Newell's, if any thing, puts a more serious face upon the Argentine ant as a possible pest in California, for here we have commercial apiaries that will be inevitably invaded unless heroic measures are taken by the State, looking toward restriction or eradication.—R. B.

them, in regularly established ways. They were seen to be patrolling all crevices, and were quite active about the entrances to the colonies. Whenever the ants and bees came in contact the latter appeared very excited. This excitement was manifested by an incessant buzzing of the wings, emitting a peculiar note on the part of the bee indicative of her irritated yet helpless condition. The ants boldly approach the bees as the latter seek to patrol the entrance or other opening, and, catching the bees by the legs, wage an assault. The bees, enraged, frantically keeping up their buzzing, helplessly run about in an effort to release themselves, frequently being forced to take to their wings before being able to ward off the attacks of their little adversaries. So far as I was able to observe, the general appearance being to the contrary notwithstanding, the bees in all cases were holding their own, the judicious caution of the ants leading them to refrain from actually entering and invading to any great extent the colony. Subsequent examinations of the interiors of the colonies have confirmed this observation. In one colony the ants had established a regular runway across the bottom-board of the hive, but in only one instance were ants to be seen crawling on the combs of one of the colonies of bees, and then only two ants were observed making their way along the lower edge of a comb.

One of the colonies, perhaps unfortunately for itself, but certainly fortunately for the purpose of my observations, contained several extended crevices half an inch or so in width across the corner. As might be expected, the bees had tried to fill these crevices with propolis and wax quite as likely in defense against robber bees as perhaps against the ants. There were, however, a sufficient number of openings to permit of the egress of bees which were continually passing out and irritatedly buzzing as previously described. On removing a wedge from one of these crevices, thus enlarging the opening, the colony immediately threw out an extra force of police bees in defense against the ants; but, to my surprise, these bees did not seem angered toward me. In fact, I used every reasonable means to anger them individually, going so far as to pin them down to the hive-cover with my finger, all of which only apparently contributed to their antagonism against the ants. This, I say, was surprising to me, for it was somewhat contrary to my previous experience with bees when antagonized by ants.

When in charge of the experimental work in apiculture at the Montana Agricultural Station during the years 1901 to 1905, on several occasions the apiary became troubled with ants. One summer this was particularly true, and we observed the ants, which, of course, were much larger than the Argentine ant, catch and literally cut up live bees about the entrances and carry them away to their nests. This so enraged the bees that it was almost impossible to work with them, and for this reason rather than from any particular fear that the ants might overcome the bees, we resorted to the use of carbon bisulphide in the nests, which had been steadily growing until the entire apiary, which was, of course, a small one (less than fifty colonies), was encircled. This proved itself an effective remedy against the ants in question; but in the case of the Argentine ant

the lack of a centralized nest or colony, coupled with its migratory habits, of course makes such a remedy hard of effective application.

From the data here presented, which, of course, is not very extended, and so can not be regarded as conclusive, it would seem that the danger of the Argentine ant as a pest in the apiary would in most instances lie in their interference with the work of the bees rather than in actually overcoming and destroying strong colonies. Fortunately it is the habit of the bees to store their honey as remotely as possible from the entrance of the colony; and if the bees are kept in well-made hives in which there are no crevices for entrance on the part of the ants, a strong colony can undoubtedly defend itself, there being an ample number of bees for the patrol of the entrance. It may be true that, in the case of very weak colonies, incapable of defense, the ants might be able to gain an entrance, and thus destroy, starve, or force the bees to vacate. Indeed, there is one and perhaps two empty hives in the apiary, under our observation, which might lead one to this supposition. The apiary, on the other hand, is a neglected one, and there may be other causes for the loss of the colonies in question. On examining these empty hives we were somewhat surprised to find in one of them sealed honey alike undisturbed by the ants or robber bees. This condition of affairs might be due, however, to the fact that the honey cited was granulated, and so in a measure inaccessible. In any event, from present evidences we can not feel entirely safe in attributing the loss of these colonies to the Argentine ants, although the ants may have been a factor. We believe that the ants might and do become troublesome enough to the bees of an apiary to interfere seriously with the field work of the bees, and so prove themselves the cause of almost inestimable loss to the bees and apiarist alike. A fact readily appreciated must also be borne in mind—that the annoyance and even injury so persistent a pest as the Argentine ant would accomplish about the honey-house and shop of an apiary would be considerable. This would be especially manifest in the handling and storage of honey, particularly in the event of the production and care of comb honey. We have known of apiaries in this State where the common black ants have been very troublesome about solar wax-extractors, necessitating the placing of the legs of the extractor in cans of oil. It is needless to conjecture what the Argentine ant might do or become under similar conditions. In any event it must be remembered that our California infestation of the Argentine ant is as yet largely in the stage of simply a household pest, and that, when the acute stage of the infestation of orchard and field, found now in Louisiana and Mississippi, is reached on this coast, our attitude toward the Argentine ant as a possible pest of the commercial apiary may be changed. The development and growth of our ant problem is one which every apiarist in common with the orchardist and agronomist ought to and will watch with interest.

[These ants have been described in *GLEANINGS* before by Mr. O. O. Poppleton and myself. The remedy is to put the hives on benches, the supports of which are set in a pot of tar. There are only a few places in this country where these ants will prosper—that is to say, in sub-tropical sec-

tions. I doubt if they will do any real harm. They will kill off all wild bees, and apiaries poorly attended to will suffer. They are carnivorous ants to a great degree, preferring a meat diet, but will eat sugar, honey, grain, etc. They like a larva in preference to an old bee, hence they make desperate onslaughts on the bees till they get at the brood. Possibly they are a blessing in disguise.—W. K. M.]

BEE-KEEPING IN RIO GRANDE DO SUL, BRAZIL.

Much Loss, Probably Caused by the Honey from the *Herva Lanceta*; Some of the Enemies of Bees.

BY A. L. GREGORY.

The last season here was hard on bee-keepers, at least in many places. The writer, for example, secured some pure Italians and got them off to one side and began raising queens. All went well until near the middle of our summer when dry weather set in. We did not fear that, however, as the catclaw gives bloom right along; but there is a plant here called *Herva lanceta* which we have nicknamed "Brazilian goldenrod." This soon began to bloom; then we noticed that our bees began to die. Soon we found some dead queens; then more disappeared, until the hives became weak from loss of bees and queens; then our hopes went down to the zero-mark. When a queen died, the bees would try to raise another; but finally they all had to die. Each hive was left with more or less honey in it, so we extracted this, which tastes excellent, and does not make us sick. We noted that there was no disease in the brood; but when young bees hatched they soon died, or got so weak they could not walk straight, then died.

In our vicinity (near Santa Maria) all bee-men fared badly. One old German who had 39 hives now has 3; another, with movable frames also, had 62 hives and lost 57. We could cite case after case where bees died leaving hives full of honey.

When a hive got to be sufficiently weak, then the little black wasps and small black bees which we call *irapua* (described below) would come by thousands and attack the hive, actually laying hold on *Miss Apis Mellifica* and dancing her out of her home.

Bee-keepers have noticed for some years that, when the *Herva lanceta* blooms, there have been some losses in the apiary; but they have never experienced as much loss before. Where the writer had his Italians there was much of this *Herva lanceta* in some thrown-out land, hence the loss in his case of all he had. There remains much to be studied in this thing; and as the average Brazilian is too much at his ease to exercise himself about such small matters, it remains for foreigners to put themselves to the task.

There are other theories for this year's loss. One is that the locusts, which ate every thing in the spring, left a poison behind. Another is that the red bee-louse killed them; but these were very few, so could not be the cause. Some of the best bee-men are free to confess they do not know

the cause. The writer thinks it was the *Herva lanceta* that caused the loss in his case.

Bee-keeping is at a low tide in Brazil, though now the governing powers are trying to interest the common people in this marvelous industry in which there are not only dollars and cents but pleasure every day of the year.

The climate in this most southern State is about like that of South Texas. Seldom do we have more than half a dozen frosts a winter, and these are usually in July and August, the latter of which is our most disagreeable month. The poor Brazilian women have a saying that they would like to be dead during this month. We suppose they mean they would like to hibernate during this month as does Mr. Bear.

THE IRAPUA* BEES OF BRAZIL.

These small, black, long-legged bees mentioned above are not provided with a sting as are bees in general; yet they are not without a means of defense, being given by the Creator a strong jaw. They catch hold of the enemy like the ant, for example. They carry on their hind legs a sticky secretion which, coming on the wings and legs of the insect antagonist impedes locomotion and prevents fight. The *irapua* makes its nest usually in a small bush near the ground. The shape is somewhat like a big gourd inverted. The composition is the same as a wasp-nest, but has compartments and several entrances. The honey is stored in round cells the size of a hen's egg. The writer has not much love for the honey, as the bees will visit any carcass; and from the hundreds which go there it is clear they carry something away with them. This bee is one of the enemies of our honey-bee when the hive becomes weakened. When they decide to attack a hive they come by thousands and boldly enter, catch the honey-bees by the leg or wing, and drag or chase them out of their hive, take possession, station sentinels, and begin carrying out the honey. They even stay in the hive over night, so sure are they that "might makes right." One of these little insects is more than a match for *Miss Apis Mellifica* in a knock-and-scramble combat. Many times has the writer seen a honey-bee pulled out of its hive, glad to fly away from the intruder and victor. Sometimes one may see a dead *irapua* hanging to a shy *apis*.

There is also another enemy to our bees in the small black wasps. These, however, are not so bold as the bees we have described. They also build a paper nest resembling that of the hornet, divided into many parts, and store honey in the same cells in which they raise their young. We have other bee-enemies, such as the dragon-fly, and many kinds of birds and ants.

The bee business can, notwithstanding all these enemies of our little pets, be made profitable by the painstaking bee-man, of whom we need a host in our big Brazil.

Taquary, Rio Grande do Sul, Brazil.

[South Brazil can do big things in the bee line when conditions favor. As to tropical Brazil, that's another matter. *Apis mellifica* is subject to too many enemies to be a great success. The stingless bees have the American tropics pre-empted.—W. K. M.]

* Accent on the last *a*.

CURIOUS HIVES MADE BY A GERMAN SCHOOLTEACHER.

—*Courtesy of the Independent.***NOVEL BEE-HIVES.**

BY MAX A. R. BRUNNER.

Germany is known for the numerous beer-gardens found in every city; but one little place contains a bee-garden instead of a beer-garden. It is entirely the idea of its owner, a schoolteacher, who has also executed the many houses in it, although he has not, of course, any experience in it through his profession. As can be seen, the bees do not live in the ordinary hives; but in finely modeled houses, each representing a different type.

It is a fact that bees always return to the same hive, which they recognize by the color, form, or shape of opening. To facilitate this searching for their residence the hives are often of different color and size. In this garden this has been carried on to the extreme, for every hive represents a different shape. Among the buildings are a fine castle, with sentry, a dwelling-house, an inn, and a windmill. There are also men and animals, carved in wood, all in the service of the bees. There is, of course, an opening in all these models, to give access to the interior for taking out the honey.—*The Independent.*

Out of the eater came forth meat, and out of the strong came forth sweetness.—JUDGES 14:14.

EXHIBITION CASES FOR DISPLAYING COMB HONEY IN STORES.

SELLING COMB HONEY.

**Some Inducements to Help the Merchant
Dispose of his Stock; a Simple and
Neat Exhibition Case.**

BY D. R. WAGGONER.

In considering this subject it is assumed, of course, that the bee-keeper has carefully cleaned his sections from propolis and burr-combs; has graded them as to color, weight, and quality, and has them all cased in regular shipping-cases ready for market. The neighbors who come to the apiary to buy can be shown into the honey-house, where the crop is piled on shelves in cases, to select what they want themselves; but only a small part is sold in this way. We must go around and take orders for our product from merchants and others, and sell by sample.

In order to do this I take along with me a small shipping-case, holding not over twelve sections, to show customers in what style it is put up for sale. A smaller case will do just as well, and is lighter to carry. I also have a small box, or case, holding six sections, showing three on a

side, through three-inch glass. I put the lightest-colored honey to show through one glass, and a darker grade, if I have it to sell, to show through the other glass. This little box is made perfectly plain, without any fancy molding, like a shipping-case, of thin stuff, and is stained a dark oak color, and varnished. The honey looks better and whiter in a stained and varnished case than in the regular shipping-case. It is better to have the light and the darker honey show through glass on opposite sides of the little case than to have the two sorts show through the same glass side by side. Also the dark honey will sell better by having it arranged in your sample case so that, when you hold it up between yourself and the window, the light will shine clear through the case, and your customers will see that even dark honey is not as dark as they imagine.

When I sell to merchants in my home town to retail again by the single section I have small showcases, each holding from four to six sections, to let their patrons know they have it to sell. The large shipping-cases can then be kept back on the shelf, covered up out of the reach of flies and dust. I generally supply the merchant with a showcase holding and showing four sections

through three-inch glass. Every season I furnish each of my home-town merchants, who sell my honey, with one of these show-cases; fill it for him out of one of the shipping-cases, and let him use it as long as he has any honey of my production to sell. At the end of the season, when the honey is all sold, I take the case home and keep it safe until the next season. The style of the showcase is to be seen in the accompanying picture. A label is pasted on each case, showing that the honey is from my apiary, etc.

When I sell to a merchant further away I furnish him a showcase free, provided he buys five 24-lb. shipping-cases of honey, and I let him retain the case permanently. These cases are more ornamental than the little sample box or case which I carry around with me when I solicit orders for honey. They are heavier, and have molding next the top and base, above and below the glass. The base is somewhat wider than the top, to lessen the danger of knocking the case over sidewise. The case is filled from the rear. A board fits into the back of the case behind the honey, and can be wedged in, or otherwise fastened, so as to hold the honey firmly in place. Small drip-sticks and paper are used as in the regular shipping-cases.

Cases to hold six sections, showing three on a side, through three-inch glass, are furnished merchants when they prefer them to those holding four sections each. Two cases of the latter style appear in the top row in the picture. The honey is put into the six-section cases from the top instead of from behind. The top board is loose, and small cleats are nailed on the under side of it to keep it in place so it will not slide off endwise or sidewise. Both styles of showcases are stained dark oak, and varnished.

The picture shows a county-fair exhibit containing samples from the crop of 1908, and an end view is given of one case of each style in the top row.

I have found that these little cases are an advantage, both to myself and to my merchant customers in selling honey. The merchants like them very much indeed. I have made all those I have used myself, though I am not a mechanic, and they have cost 25 to 30 cents each. I think it would be well for supply houses to furnish something of this sort to their customers, and keep them in stock, as comparatively few would care to purchase a showcase as expensive as the Sturwold, made by The A. I. Root Co.

Stamford, Neb.

COMB HONEY TWELVE YEARS OLD.

BY E. R. ROOT.

The honey in the case here shown is said to be twelve years old. It is in a very remarkable state of preservation, to say the least. The cappings appear to be perfect, without break or drip. We can hardly think it possible for any honey to go this length of time without candying. Whether this did or not does not show. Granulated comb honey is likely to have breaks in the cappings; but a careful scrutiny of the engraving, taken directly from the photo, shows no such defect. Usually comb honey two years old is very inferior-looking, and a poor seller. For that reason we always advise disposing of it in the year in which it is produced, even at a low price if necessary; for after it has once candied it will not bring even as much as extracted per pound, for the reason that the average person does not know how to render such honey without spoiling the flavor of the honey at least, although we shall show in a future article how this *can* be done.

Some honeys will remain in a liquid condition much longer than others—notably Rocky Mountain sage. Any honey kept in a hot room of *uniform* temperature will remain clear much longer than that which is subjected to a temperature of

THIS HONEY IS TWELVE YEARS OLD; THERE IS NO CHANGE IN IT, AND, SO FAR AS APPEARANCES SHOW, IT IS NOT CANDIED.

BRITTON'S SHED FOR WINTER PROTECTION.

from 80 degrees down to nearly the freezing-point. We can only *guess* that this honey was kept in a favorable temperature, and that it is of a kind that does not candy readily.

WINTERING BEES IN A SHED.

Home-made Winter Cases.

BY E. C. BRITTON.

The illustration shows my colonies in their winter home, where they will need no further care until next spring. I have been feeding those that were short of stores, until all have food enough to carry them through the winter. I used one part of the best fine granulated sugar and one part water to make the syrup. Here in this part of the country the bees gathered no surplus honey last season in July or August, but gathered some in June and September.

The hives are the regular eight-frame dovetailed style. I made the winter cases just for the pleasure of doing it, and because I could try different kinds. The bottom-boards are 17×23. The outer cases are 16¼×22¼, and 18½ inches high, so I can put on a super in summer and have both hive and super enclosed. The roofs are of different kinds—some hip, some common, four-sided, and shed, and are fastened on to the outside case with a small hook at each end. These cases give a half-inch air-space all around the hives, and on the top there is a super-cover; then a super filled with chaff, and finally an air-space under the roof. The entrances to the hives I reduced to ¾×3 before putting on the winter cases. I have put them all in a shed, closed on three sides and open to the south. There are two rows, one back of the other, and a little higher up, so the bees get a better flight space.

To examine any of these hives I just push back the hooks at each end and take off the roof, then lift up the outside case, and the hive is exposed to view. They can each be taken apart in a moment. On warm days the bees can all take a flight, but I shall place a board in front of each

one.—Ed.]

A FEEDER FOR THE BACK OF A HIVE.

BY ARENT BRUHN.

The photo shows my way of feeding bees. The box holds one quart, and is hung on the back of the hive. I can fill it any time, day or night. By means of the glass cover I can always see how much the bees have taken, and I then feed more if needed, or stop the hole and take off the feeder for another hive.

Enumclaw, Wash.

[Such feeders are used to some extent, a similar one, with the exception of the glass cover, being illustrated last year in our Sept. 15th issue, page 1212. The glass cover would be convenient but more expensive.—Ed.]

BRUHN'S GLASS-COVERED FEEDER FOR THE BACK OF A HIVE.

entrance in the front row, so the sun will not call them out when it is too cold to fly.

Canton, Mass.

[This shed, or, in fact, any open shed, serves only as an excellent wind-break. If the back and sides be closed it will cut off the wind in front, just the same as a bug-gy-top facing the wind stops the force of the blast against the face of the driver; but if the back curtain be up the wind will shoot right through. In all open sheds the back and sides must be closed. This is a very old idea of wintering, but a good

A CONVENIENT EXTRACTING-ROOM.

BY CARL H. HANSEN.

The arrangement of the extracting-room shown in the engraving is the most satisfactory that I have ever used. The extractor is more stable than I have been able to have it when placed on a box; furthermore, I find it easier to turn the machine when it is low down. The position of the honey-pail is a disadvantage; but if next season's crop warrants the expense I shall arrange to have the honey conveyed through a pipe directly to vats in the cellar.

The extractor is placed at the edge of the trap-door opening into the cellar. The honey, after being drawn, is emptied into large earthenware jars or into tin pails. The extracting completed, we wash the extractor, place a large piece of cheesecloth over the top of the extractor-can, and fasten the cloth with a heavy cord. The honey is skimmed, and then strained into the extractor-can. After the bubbles of air have risen to the surface we run the honey directly into pint Mason jars, and finally put on the labels. We do not heat the honey, as our trade does not demand it. In fact, many prefer it in the candied state.

Madison, Wis.

[The arrangement here shown is good—much better than an extractor set up on a box. One can better afford to cut a hole in the floor in which to put the pail, and, when the extracting season is over, cover it with a trap-door. A better arrangement, as suggested, is to run a tin pipe to convey the honey to a tank on a lower level. The trouble with running the honey direct into a pail is that one is likely to forget and let the honey run over and waste. Enough is lost in this way to pay for a tin pipe in a short time.—Ed.]

ATWATER'S QUEEN-FINDER.

How to Use them with Sectional Hives.

BY E. F. ATWATER.

Years ago, when I was greatly interested in the divisible-brood-chamber (or sectional) hive, I gave a great deal of study to the methods best adapted to its management. From the late S. P. Cully, of Higginsville, Mo., I obtained the idea of the queen-finder, as shown in the engraving. It is simply a light box, about 7 inches deep, 20 long, 18 wide, having a rim of $\frac{3}{4}$ -inch sticks, nailed about two inches from the bottom, all around the inside. On this rim is nailed a large sheet of queen-excluding metal. Around the upper edge is nailed a strip of tin, projecting in-

INTERIOR OF HANSEN'S EXTRACTING-HOUSE.

ward $\frac{1}{2}$ inch all around. To use with the divisible-brood-chamber hive, after removing the cover from the hive drive a few puffs of smoke over and into the upper brood-case, which will usually drive the queen and the bulk of the bees into the lower case. Quickly lift off the upper case and set it aside. Pick up the lower case and place it on the queen-finder. Smoke the bees down, when a quick jar will send them into the finder. Many of the bees will at once pass down through the zinc, while the others will spread out over it and climb the sides of the box, where their progress is interrupted by the strip of tin.

Keep a sharp lookout, and jar or shake the finder to prevent the bees from passing over the upper edges, and to keep them from moving down through the zinc. The queen is usually seen in a moment.

With standard frames I prefer to find the queen by looking over the combs for her; but if she is not readily found, all the bees may be shaken into the finder, where the well-known "stride" of the queen makes her easily seen.

Meridian, Idaho.

[This is a very serviceable device. It has been described in these columns before, and we wonder that it is not more generally used by the shallow-hive men. This is one of the handy things that can be made up during the winter for next season's use.—ED.]

COMB FOUNDATION.

A Discussion of its Use in Frames; the Cause of Buckling; Thinner Top-bars and Vertical Wiring Preferred.

BY R. S. PENNELL.

We have always been dissatisfied with the top-bars of the frames. On account of the groove-and-wedge plan, they have to be made too thick, or at least this is the reason we assign. In our opinion the theory that this extra thickness hinders the formation of burr and brace combs is a fallacy; for as soon as the bees get the bars stained and propolized, they are no better than the thinner and narrower top-bars. The wedge and groove is the biggest nuisance that we have to contend with. It is not reliable if the frames are hauled to an outyard, in this climate at least, unless the wedge is secured with at least three nails. In forcing in the wedge the foundation is flattened so that all traces of the cell-base are pressed out. Now, the effects of this flattening on the foundation are just the same as if one edge of a

ATWATER'S QUEEN-FINDER.

piece of tin were drawn out with a hammer—the drawn part is wavy, thereby causing a strain on the tin that is undrawn.

The effects of the wedge on the foundation are just the same as the hammering on the edge of the tin; and the tighter the wedge fits, and the hotter the foundation, the greater the damage.

Then if the spur-imbedder is run across this three or four times, and if the foundation is hot and soft, it is necessary to get the frames in a hive containing a good strong colony of bees immediately, or a slight change in the temperature will make the foundation look like the bent and twisted irons of a burned building.

We have taken particular notice of the effects of working hot or cool foundation, and we find that we get better results from the latter as to buckling and sagging in this climate. During the summer we have found that the foundation is generally just right the first thing in the morning.

We don't want our foundation cut when imbedding. We want the wire forced into the cell wall with as little damage to the cell base as possible, and with an even pressure. If the foundation is too warm and soft, and the pressure too great, the foundation is flattened, and the effects are the same as those from the wedge, but on both sides.

The frame which suits us best is one with a $\frac{1}{2}$ -inch top-bar, with or without a saw-kerf as a guide for the foundation in waxing. The frame is wired vertically with a splint of wood or a piece of wire or tin in the center, parallel with the wires, to support the top-bar. By using such a splint a much thinner top-bar can be used, like those in the old Simplicity frames, which are only $\frac{5}{16}$ inch thick. With this plan of wiring and fastening the foundation we think there will be scarcely any sagging or buckling.

We are indebted to the old Simplicity frames we have for some of these ideas, as we always noticed that these frames are invariably extra fine on account of the vertical wiring, tin splints in

the center, and the $\frac{1}{16}$ top-bar. This latter gives $\frac{1}{2}$ inch more comb per frame or 4 inches extra, amounting to half a frame in every eight frames.

Fort Collins, Col.

BEE-KEEPING IN CUBA.

Moving Three Apiaries 350 Miles on a Schooner; a Venture which Proved Disastrous.

BY FRANK REIMAN.

After keeping bees for several years in the southern part of the province of Havana, and being terribly annoyed by thieves, revolutions, and half-civilized people who hate the Americans, I decided to look for a more agreeable place. In the insurrection a year ago I suffered about \$1000 damages. The claims commission gave me \$500, and reminded me that this is what I could expect in a half-civilized country. Last May seven armed men entered the apiary and stole what they wanted; and after that set fire to the bee-yard and burned fifty hives of bees, honey-house, and all the contents. The loss was estimated by the judge at \$550. For this I tried to claim damages as an American citizen, and was told that I would not be troubled in this way if I lived in the United States, and he would not consider the claim. The average Cuban is far inferior to the North American Indian. They possess all the bad traits of the Indian, but after that they are the most cowardly race on the face of the earth. I would advise any American who desires to settle in Cuba to locate in the eastern provinces, where there are many Americans, and the people are very decent. I had been looking for two years for a place, and decided this part was best, so concluded in August to move every thing here as soon as possible.

How to move was the question. I could not sell at any price, and decided to move by schooner. I chartered a schooner for \$250 to take all the bees and fixtures for 600 hives. The schooner was represented as 40 tons, but proved to be only 30, and was too small to carry all, so I had to take apart over 100 hives.

I first had to cover 450 hives with wire cloth, which cost \$50. The carting cost \$80, and the moving by boats in a ditch two miles to the vessel cost \$35. After loading 300 hives a storm set in and upset many hives in the hold, so I had to move the mess back to the shore next day. The unloading and demurrage of the vessel cost \$120. After this I had the bees on shore for 30 days to get in condition, as the brood was nearly all lost, and the 450 hives came down to 225. These were loaded, then half packed in wire cloth, and the other half loose to do what they pleased in the bottom of the vessel—another cost of about \$27 for loading.

We started in a magnificent wind, and made many miles until 6 o'clock, when the captain anchored the vessel and said we would sleep there. For eleven nights we anchored in spite of protests I made to the captain; but he and the crew were a sleepy set, and refused to sail by night.

We arrived in 12 days—eight days overdue. I immediately filed a protest with the consul, who

had the cargo examined, and pronounced the bees a total loss. I succeeded in saving about 50 hives of those that were loose, but those in wire cloth all died. None of these had either eggs or brood except three of Italian, red-clover stock, which were of a lot of ten I received in July. These were ready for work at once, and laid in quite a lot of surplus while I still battled with many of the others to get new queens introduced to them.

The greatest mistake the Cuban bee-keepers make is to let the stock go too long before introducing new queens. Stock deteriorates very rapidly here, and some new queens should be bought every year. In Cuba it is impossible to raise good stock, so we must send to the United States. Red-clover long-tongued stock I find the best. Black bees we can not use, as the moth-worms often eat a super, honey and all, even when the hive below is in good condition. I think the great improvement in the honey queens has been the cause of overstocking the market more than any thing else. With the black bees the yield used to be from 5 to 10 lbs. a hive; but now it is 50 to 100. In Cuba a good hive of Italians can make a barrel of honey in a year when the natives make only from one to five gallons a year. I have since purchased and transferred 170 hives, and have now over 200 in working order, and am awaiting results in my new district.

Manzanillo, Cuba.

COMB-HONEY SUPERS.

When Shall They be Put on and Taken off? Shall Empty Supers be Put Above or Below the Full Ones? Some Excellent Advice for the Comb-honey Producer.

BY DR. C. C. MILLER.

What a changeable business bee-keeping is! No danger of a wide-awake bee-keeper stagnating from the monotony of his business. Always unsolved problems, always new problems arising. I still lie awake nights studying over them with just as keen interest as I did 47 years ago.

Take the matter of supers. When shall they be given? When taken off? Shall a fresh super be given above or below the one or ones already on? I confess I don't know—at least I haven't it down to any fixed rule, but must constantly be deciding each case afresh.

Almost, however, the question of putting on is settled; practically, it is. When I see the very first white-clover bloom I get supers on as fast as convenient—not that the bees will use them at once. I watched the thing very closely the past season, and it was just ten days from the time I saw the very first clover-bloom until I decided the bees were harvesting more than enough for their daily needs. So it might do to wait that ten days. But during that time the bees are getting acquainted with their new store-house; and when the rush of the harvest comes I *think* they commence storing above a little more promptly than if the super be not given until the very day they absolutely feel the need of it. Yes, I feel quite sure they do, and that little difference may make all the difference between their deciding to swarm and their not deciding. And that differ-

A CORNER OF DR. MILLER'S HOME APIARY, SHOWING THE STACKED-UP COMB-HONEY SUPERS.

I should have lost heavily if I had tried to limit each colony to two supers each; and there would have been loss—I think there was loss in some cases where there were only four supers, as shown by the honey and comb (especially comb) jammed in between supers. When bees are badly crowded, don't they hold the honey in their

ence in deciding may make a notable difference in the amount of surplus honey stored. So for years the appearance of the first white-clover bloom has been the signal for putting on supers.

"But don't the bees spoil empty sections when they are not storing?" Sure—plaster glue all over the wood, sometimes varnish the foundation with glue so that they refuse to accept it the following season, and sometimes gnaw the foundation badly. But that's just after the close of the harvest, not just before it begins. Bees use little or no propolis early in the season; they're not gluing up cracks, getting ready for winter; and for some reason they don't gnaw foundation as they do in the fall. (Don't they gnaw it in the fall to use as bee-glue?)

Just when to clean off all supers is a different thing. If the harvest would only shut off in an unmistakable manner all at once! but it has a trick of gradually tapering off, making it impossible to tell just when *surplus* gathering ceases—at least, that's the way often. One wants to leave supers on just as long as the bees continue storing in them. But how can one tell? This year, when I took all off, I found a few empty cells in some sections. The bees had already done a little carrying-down—not enough to make any important difference, but enough to show me that I didn't know enough to guess the right time to take off supers.

Shall additional super room be given above or below supers already on? and how many supers shall be on at once? That picture of a corner of the home apiary shows that I haven't settled down to the plan of allowing the bees to confine their attentions to only two supers at a time. July 18 here's the condition of affairs in the home apiary: 1 colony with 2 supers; 18 with 3 supers each; 27 with 4; 31 with 5; 8 with 6.

That makes the average a trifle more than 4½ supers to each colony. If the inventory had been taken at some other time I think the figures would have been larger, for I know there were at one time a very few colonies with 7 supers each. As the years go by I think I incline to give more and more room when a big flow is on. I'm sure

sacs and turn a lot of it into wax?

Shall the empty super be given above or below? Sometimes one place, sometimes the other; and I don't always know enough to say which—often under; always under when there is a good flow on with every prospect of a continuance. Well, that hardly tells the truth either—at least the whole truth. In many cases this year I gave an empty super under, and at the same time an empty on top of all. I wouldn't do that except in a good flow which promised to continue. But that empty on top—mind you, always in a good flow—can do no harm. The bees are too busy storing to do any mischief to the empty sections; the super-room is kept just a bit cooler in a hot time, and that upper super acts as a safety-valve in case the bees should happen to need the room.

I know there are good men who say, "Never give an empty super under." Of course, I know that hastens the finishing of the lower super or supers. But it hastens because it crowds the bees. It takes more crowding, too, to *start* storing in an upper than in an under super. And that crowding has such a great bearing on the swarming problem that I never want bees to feel they are crowded for surplus room. I want them to feel they have plenty of room—yes, abundance of room; in short, I want them to feel they have a surplus of surplus room.

A STRONG ARGUMENT FOR PUTTING THE EMPTY UNDER THE SUPER PARTLY FILLED.

There's one item in this matter of putting empty supers above or below that I don't remember ever to have seen mentioned in print; yet it has a very important bearing. You know you like to have the bees commence work in a super all over at once, the work just as well advanced in the four corners of the super as in the center. To me the prettiest sight in a super I ever saw is a set of sections exactly alike in advancement, every section nearly filled, but not a cell yet sealed. No, it isn't so pretty a sight to see the 24 sections all sealed with their snow-white cappings—not to me; for the sight I've described pictures a strong flow, a strong colony, and work of the

most uniform character. Well, I get that sort of work sometimes—not so often as I like—when I give a fresh super under to a strong colony in a strong flow. When I've given a super on top I never had such a state of affairs—never. The center sections were always well in advance of the outer ones, if, indeed, the outer ones were attacked by the bees at all. So, other things being equal, that matter of even starting all over the super is enough to settle me in favor of putting the empty super under, so long as I have any reasonable hope that the season will continue until the super is finished, or nearly finished.

When the season is well advanced, and it's a question whether an additional super is needed, that's another thing, and the super goes on top. Besides, crowding late in the season doesn't have the same effect as early.

But I hear some one say, "Your locality must be different from mine; for I've often given empty supers on top when the bees would commence just as promptly at the corners as at the center; in other words, I've had exactly the same kind of work with supers given above that you brag about getting with supers below." Well, I don't feel like disputing your word; and it isn't locality that makes the difference either. You don't give the room till the bees are so crowded that they're glad to occupy all the room at once. Let's not quarrel. If you like your plan it's all right. But I'd rather not crowd so much. I'd rather have less crowding, less secretion of extra wax, less inclination to swarm, and a little larger crop of honey.

Marengo, Ill.

[Like the doctor, we don't think that this idea of putting the empty under the partly filled super for the express purpose of securing more even filling of *all* the sections alike in the super has been mentioned before in print. Perhaps this has not been the experience of others. We should be pleased to hear from any one who has or has not observed the same thing.—Ed.]

MAKING INCREASE.

The Alexander and Somerford Methods Compared.

BY CHAS. REYNERS.

On the whole it seems to me there is scarcely an authority in bee culture superior to Mr. E. W. Alexander; at least, whatever conclusions emanated from him seemed eminently correct; yet in the A B C (1908 edition) there seems to me to be a contradiction which I ask you to explain. On pages 279, 280, you set forth the Alexander method of increase. On page 310 you deal again with the subject of increase together with that of nuclei. Considering the method of Mr. W. W. Somerford it would appear exactly applicable to colonies as well as nuclei; and if Somerford's method works (he says that *each colony should make four or five divisions*) what is the use of the Alexander method, pages 279, 280? Who would merely double his colonies when there is a possibility of increasing them four to five times? If both methods are equally reliable it would seem that the Alexander method could be dispensed with, however good it may be.

Then as to the Alexander method itself. The directions provide merely for doubling the number of colonies (every thing pertaining thereto "being equal"); but in the instance given, Mr. A.'s son is said to have made 20 colonies out of 9. Doubling 9 would make only 18, so some of the colonies must have been triplicated. How, then, was the triplicating done? Please explain exhaustively as to the relative peculiarities and reliability as between the Somerford and Alexander way, and then as to the Alexander triplication. I have only one flourishing colony of Italians, which I am trying to bring through the winter just as well as possible; and if I succeed I want to do with the same as nearly best as possible.

Finally, I should like to know how long queens can be kept before being introduced. I expect to see a predicament in the matter herein at first dealt with, in having new queens at hand at just the right time. How can one manage that? I have a neighbor living a mile west of the Susquehanna River, while I live ten minutes' walk east of the same. I may be able to get queens from him, but he may need a few dozen himself, and he has some fear that he and I together may overstock this country. The next apiarist of any account lives six miles further away. There are all sorts of territory here—cultivated land with clover and buckwheat; woods, pasture, waste land, etc. Ulster, Pa.

[Why, friend R., there is no conflict whatever. You did not read very carefully the first column on page 279. The Alexander increase is based on the idea of securing a *honey crop* as well as an additional number of colonies. Indeed, the very first sentence referring to this method reads:

INCREASE. Under the head of NUCLEUS several methods of forming nuclei are explained, but under this head we shall deal with the subject more from the standpoint of the honey-producer who actually desires increase and at the same time produce a crop of honey.

The Somerford plan involves only the largest number of colonies possible from one without reference to honey. You see there are two separate ideas—one aiming at a honey crop and increase; the other, maximum increase only.

Regarding the 20 colonies and the 9, it is probable that two of that 9 were strong enough to make two other colonies each. In following an author one will, of course, be governed by conditions and not by absolute rule, the rule being only a guide.

Queens can ordinarily be kept a week after they are received from the mails; but the sooner they are put in the hives the better. It is not necessary to prepare hives for the reception of queens. As soon as queens arrive, go to the colonies to which you propose to introduce them; remove or kill their queens, and cage the new ones at the same operation. Indeed, one may cage a queen in a colony, fixing her cage so that she can not be released for from 24 to 48 hours. During this time the old queen can be allowed the range of the hive. At the end of the time stated, the old queen should be removed, and the cage with the new queen should be so fixed that the bees can automatically release her by eating away the candy.

We wish we could do something to get rid of the notion that a colony must be queenless three

or four days before the introduction of another queen. We presume half of those who receive queens will actually keep them in the house for two days after the old queen has been removed, and then proceed to cage her. This is a great mistake. She should be put in the colony at once.—ED.]

HEADS OF GRAIN

FROM DIFFERENT FIELDS

HONEY THAT CANDIED AS SOON AS CAPPED.

My bees made nice honey last spring, but we had a drouth, which, excepting a few slight showers, lasted all summer and cut the honey-flow accordingly. About September the bees began working again, and in a short time had accumulated a surplus of honey. This had a good flavor, and was white in color; but all of it had granulated in the comb before being taken from the hive. The degree of granulation varied, even in one section, for part of a section would be very granular while the rest of it was only slightly so. "Mushy" would best describe the condition. The wax in the comb was noticeably thin, being hardly thick enough to be objectionable when eaten. There was a little very dark-amber honey which was not at all sugary.

The honey was taken from the hive as soon as capped over; and some kept in an unheated store-room and some in a room always kept warm; but I noticed no difference in the keeping.

So far as I know, most of the honey was made from sumac and a tall white weed which some call bonaset; but I doubt if this is the true name. The bees were also busy around sheep-burrs, Spanish needle, smartweed, wild sage, rosemary, and a tall yellow flowering weed that grows along roads and in swamps, and a number of such growths.

We have fields of broom sedge all around us, but I did not notice bees around that; and any way, this broom sedge we have with us always, and the sugary honey is something new.

I do not understand the care of honey, as I have just begun to try to handle bees, and so would have thought the condition of honey due to my ignorance if it were not general throughout the county. Some of the honey sold is in a very much worse condition than mine, being quite dry, and can be eaten like candy.

I have lived in this vicinity a number of years, and never heard the complaint before; but older residents say that it is owing to the dry weather, and that it often occurs in dry seasons.

Port Tobacco, Md. MARGARET GRAY.

[It seems to me you waited too long before you removed the honey from the supers. When half of the sections in a super are finished, take them out and put the others in the center to be finished. This applies to fall honey particularly. The colonies dwindle down until there is not a sufficiency of bees to keep the honey warm. Dry weather does accelerate granulation. The honey from some of the plants you mention is much inclined to granulate, and the dry weather makes matters worse. Further experience will enable you

to prevent largely this trouble in future. The flowers sent are asters.—W. K. M.]

KEEPING ANTS OUT OF HONEY-HOUSES IN WARM LOCALITIES.

I have a very simple yet effective method of keeping ants out of buildings, that I have used for twelve months or more. It is nothing more than having the house stand on posts (mine is on posts made of mulberry wood). A box surrounds the bottom of the post, which is filled with cement, and a trench 3 inches deep and about 3 inches wide is made in the cement. This will hold water three or four days or longer, even in hot dry weather; and when it rains the trenches are filled up without any help. When it does not rain, of course one has to fill them. The plan is far ahead of any thing else I have ever seen.

Macon, Ga.

HARRY GRIFFIN.

[In the northern States ants do not prove to be a serious enemy to the bees or bee-keeper, and, consequently, no special provision needs to be made other than to find the nests and destroy them.—ED.]

MOVING COMB HONEY SUCCESSFULLY ON A WAGON; UNITING COLONIES.

You wished to hear from those who have had good success in carrying section honey to market. I take the sections out, clean the super and sections of propolis, return them to the super, thoroughly wedge them in, put them in a box, tiering them up. I put hay in my lumber wagon, set my box in, and it arrives in town in perfect condition; and when I tell you it goes over the roughest roads you will see this is remarkable.

I started in the spring with 11 colonies and now have 31. I might have had 50, but I united them by putting paper jabbed full of holes on top of the hive I wished to unite, and set the other hive on top of it, and always had good success except once, when the upper bees got into the lower hive too quickly. They fought and killed each other; but two good smokes in the entrance made them think of something besides war.

Brainerd, Minn.

J. F. WATSON.

IS IT ADVISABLE TO WINTER BEES IN BUILDINGS ABOVE THE GROUND?

I am often asked if it would be a good way to winter bees by putting them in a barn or out-house. For instance, could they be put in a honey-house and the entrance closed up with wire so they could not come out? Would you advise me to winter them that way? I have not a good cellar to winter them in.

Schenectady, N. Y.

H. GREULICH.

[It is not generally advisable to try to winter bees in a room above ground, and still more inadvisable to shut them in the hive with wire cloth. While some make it a success, the beginner, we feel sure, would make a failure of it. A repository under ground will maintain a more uniform temperature; while one above ground will often become so warm that the bees will become uneasy—particularly so in mild weather. In very cold spells also the temperature may go down to freezing and below, and this is quite as bad as letting it go too high. In indoor wintering it is very important to maintain a uniform

temperature. If this can not be secured, a large amount of ventilation must be provided in such a way as not to let in light.—Ed.]

WHY HONEY SOMETIMES FERMENTS IN THE HIVES.

I have noticed the different articles in GLEANINGS on fermentation of honey in the hives, and have just read the one on page 1254, Oct. 15th. I have had considerable experience along this line, and I find that the main cause of fermentation in our locality is too much rain when the alfalfa is in bloom, or the giving of too many extracting-cases of fully drawn combs at a time, inducing the bees to bring in more of the thin nectar than they can take care of, resulting in the fermentation. I have seen it so bad that some of the cells would burst open after being capped over; and my remedy has been to extract the honey and throw it into the vinegar-barrel or use it for spring feeding. In hives run for comb-honey I seldom have such trouble.

Fermentation often takes place in hives with the strongest colonies. I have never noticed the bees dying in such hives, but they get very uneasy, and cover the front end of the hives for days, and show other signs of uneasiness. The honey sours, and the caps burst open, thus keeping the bees busy cleaning up over and over. To prevent this, run for comb honey or don't give too many extracting-cases of drawn combs at one time.

After the honey has begun to ferment in the hive the combs may have to be extracted two or three times to stop it.

Augusta, Kas. R. L. SNODGRASS.

A BEE-VEIL IN WHICH THE WIRE CLOTH IS SHADED.

Wire-cloth veils are the most satisfactory of all. I have worn them for years, and would not tolerate a soft veil. I have found them much more satisfactory when sewed to the brim of a stiff straw hat. I sew the wire cloth to the hat-brim so that more than half of the brim will project over the wire cloth which shades it. Then I can see through it better.

Fillmore, Cal. W. C. GATHRIGHT.

MOVING COLONIES FROM OUTYARDS.

What is the best way to move bees from out-yards after Nov. 15, to home yards, a distance of four miles? Would it be best to move in the fall or spring? Why?

A READER OF GLEANINGS.

[Use a spring-wagon, or else plenty of straw under the hives. Any time may be selected after the bees have ceased to fly every day. Cover the entrances with wire cloth.—Ed.]

HOW SKUNKS SOMETIMES DO SERIOUS DAMAGE IN A BEE-YARD.

While looking through my apiary to-day I saw signs of skunks that indicated they were destroying many of my bees. These signs might not be noticed by one not having had experience. I think many cases of bees not wintering well on their summer stands might be traced to the depredations of these animals. My apiary is located in a village lot, and very near the house, or I might not have discovered the midnight thieves.

Several times last fall we heard a faint scratching on some of our hives in the evening; and as some of our bees were very cross I took a lantern and went to discover what was disturbing them. I found two or three skunks at different hives eating more bees than most of us can afford to lose at this time of the year. I killed five, but still they came. I finally stopped them by placing poultry netting around the entire yard, but they had so weakened several colonies that they did not winter, and many more came through very weak.

I told my story of my night visitors to several of my friends who keep bees, and in every case they trapped and killed several of the "varmints."

Bees visited by skunks will be very cross, and will come boiling out of the hive on the least provocation. The alighting-board will show claw-marks, and look dirty; and you will sometimes see many bees killed but not eaten.

East Trumbull, O. W. C. EASTMAN.

[We have had reports before, showing that skunks in some localities do serious damage to a bee-yard.—Ed.]

WHY DID THE BEES TEAR DOWN THE QUEEN-CELLS?

What causes the bees to tear down the queen-cells at about the time they are ready to cap over? I have been troubled more or less all summer by having them removed at about the time they are capped. I have tried queenless bees, caging the queen, fastening her up at one side of the hive with a queen-excluder, and placing them over a queen-excluder on a strong extracting colony, but they removed them all in about the same proportion; that is, they tore them down one way as much as another. It does not make any difference if honey is coming in or if I feed them. I have used black, Italian, Carniolan, and Caucasian bees for building queen-cells. Caucasians and Carniolans are the best cell-builders with me. They remove the finest cells of any. Now, I should like it if you can tell what causes the trouble. I have tried about all the plans of raising queens I have ever heard of or can think of that should cause them to tear the cells out; but I can't tell why they keep on doing it.

Baldwinsville, N. Y. EDW. REDDOUT.

[The tearing-down of the queen-cells as here described, we should say, was due to the fact that a virgin hatching much ahead of the rest was responsible for the mischief. As she was looking very much like a worker after the first 24 hours, you might have failed to note her presence. There is no reason why uncapped cells in a queenless colony should be torn down unless there is a queen loose. In rare cases the inmates of the cells might be affected with foul brood, and die from disease before maturity.—Ed.]

BEE-PARALYSIS.

A conference was held last week in West Maitland, on the above subject, by three of our leading bee experts, viz., Mr. W. S. Pender (N. S. W.); Mr. Beuhne (Victoria), and the writer of this article. Mr. Pender kindly provided microscopes for the occasion. Mr. Hutchison, in supplying the subjects for investigation, said he

had considerable difficulty in being able to procure them. They consisted of a dozen bees in the last stage of that dread disease paralysis. Two years ago in this district and in many other districts it was almost impossible to find an apiary which had no signs of it. To-day it was just as impossible to find an apiary which has any affected bees, which, in his opinion, proved that severe winters have a deal to do with causing the disease, and the only cure he knew of was a good honey-flow and a little patience. Mr. Beuhne said that what was classed by apiarists as paralysis was, in his opinion, three distinct diseases, and until they can be identified separately they can not expect to effect a cure. He believed in purchasing his breeders from an apiary in which the disease had visited previously to his purchase, as reliable queen-breeders would be certain to breed their stock from such colonies as were proof against it. Mr. Pender said he discovered the presence of bacilli in the intestinal tubes of the bee by aid of the glass, but was not sure whether they were propagated by the disease or whether they were directly or indirectly the cause. No definite results were obtained, and they adjourned till some future occasion.

J. A. HUTCHISON.

West Maitland, Australia, Sept. 14.

VERTICAL WIRING.

Some of your readers may be interested in a plan of upright wiring of frames, which I am now practicing, and which seems to me not only simple but effective, in supplying much more resistance to the sagging of foundation.

Where there is no groove in the top-bar the plan is both easy and inexpensive. Simply bore four small brad holes in the center of the bottom-bar at suitable distances; run a gauge along the under side of the top. Mark this to correspond with the bottom holes, and hammer home as many small blind-staples. Thread the wire from right to left, which first fasten with the usual tack on the edge of the bar; provide a small strip of wood to place temporarily in the center of the frame while tightening to stop the bottom-bar from being pulled up unduly. Even where combs have to be cut out occasionally, the staples, being almost out of sight, need never be disturbed.

New Zealand.

THOMAS SUTHERLAND.

[The plan here spoken of is feasible, but it involves a great amount of work; but the result in the end might be more satisfactory than the present horizontal plan.—Ed.]

HOW TO TEACH CHICKENS TO CATCH DRONES.

I wish to tell you how I teach my chickens to catch drones. First I shave cappings of sealed drone brood (if they are just hatching, so much the better), and I throw a few of them on the ground, then I hold the frame and let the hens take the larvæ out. The chickens can beat me for getting them out fast. Repeat this a few times. They learn quick. I went out this summer at 2 o'clock one day, and saw not less than six broilers stationed at as many hives. I watched one in particular. He caught 16 drones in a few minutes, always dodging behind some foliage to eat them; but after he caught the sixteenth

one a bee took him under the beak. Then he jumped up and down. I saw them day after day station themselves at the hives as soon as they heard drones flying. They beat all other means I have tried, for it is only a short time before drones are scarce where the hens tend a hive. I then sold my broilers. It is very amusing to watch them.

Fremont, Mo.

MRS. ALMEDA ELLIS.

[Many thanks, my good friend, for the facts you have given us. I presume drone brood or live drones would be excellent food for growing chickens; but we can hardly as yet afford to advertise them at "ten cents a bushel." As I have remarked before, it is a rather expensive kind of chicken food—that is, if we should undertake to rear drones on purpose for chickens; but after they are started, the sooner they are given to the chickens the better for the bee-keeper. Every effort possible should be made to stop the production of useless drones; but after they are once hatched out in the hive, by all means teach the chickens to catch them.—A. I. R.]

HONEY SPOILED FOR TABLE USE BY BOILING.

I bought some honey (?) from a dealer, represented as "very nice-flavored honey, dark-colored," etc. I put some on to boil; and as soon as it was hot a very thick brown scum formed on top. The scum was removed, but it kept forming. After boiling 30 minutes there was a thick dark substance, about like jelly, commenced to form in the liquid. What substance could the bees gather that would do this? Should I ask the dealer to exchange this, or will it be all right to put this out under a "pure honey" label? I can not help doubting its purity.

Randolph, Nebraska.

B. F. SMITH, JR.

[There is no evidence to show that the honey was not pure. No honey should be boiled in the manner that you have explained; in fact, almost any pure honey, after that kind of treatment, will have a scum form upon it; and if the honey be dark, such scum will be brown in color. The only time bee-keepers ever boil their honey is when it is suspected that it may contain the germs of disease. Such boiling, however, always spoils it for table use; and, really, it is fit only for manufacturers' use or to feed back to the bees.—Ed.]

SOME OBSERVATIONS AFTER 20 YEARS OF EXPERIENCE.

I have run my apiary for extracted honey some years, and for comb honey in others. Some seasons I have produced both. To produce comb honey the bees work in an abnormal condition. With large hives, and plenty of room, little or no swarming results. This is a natural result—a normal condition. Bee-keepers are up against the side of a mountain in trying to combine comb-honey production and no increase. Comb honey and extracted in the same super is a failure as regards comb-honey *quality*, in my experience.

I find $\frac{3}{4}$ hive-bottoms a nuisance. They soon get as shaky as an old politician. Mice *will* gnaw through them.

Every colony I lost this winter was caused by a warped or cracked cover. A first-class cover means, nine times out of ten, a first-class colony. Water always freezes at the top. Look at a tub

on a cold morning. Where do you find the ice? Cover over your tub and see the difference. Nothing is better than a warm tight top to a hive. I shall not remove a cover or loosen one before May 1.

I can tell from the entrance whether a colony is queenless. The loads of pollen indicate prosperity, and the exact condition can be read at a glance.

The only way to keep bees is to keep them at the front. Let other matters take the side track. Bellevue, Neb. A. H. HOOD.

SOME EXPERIMENTS TO SHOW THAT BEES ARE ATTRACTED BY THE NECTAR RATHER THAN BY THE COLOR OF FLOWERS.

On p. 1189, under head of "Are Bees Attracted by the Color of Flowers or by the Nectar?" the idea is expressed by Mr. Buttel-Reepen that bees are attracted by the color. I made observations and found that bees went to cosmos from white to red, to African marigold, to the different colors, from light yellow to dark brownish red; to cannas, all colors; to dahlias, also to all colors ranging from white to dark red. At dahlias, however, bees often hesitated, coming from the simpler kinds to those filled up more like cactus dahlias. I have also seen bees going from yellow flowers of one kind to yellow flowers of another kind, but did not touch; for instance, from yellow dahlia they flew to the fall sunflower, and flanked off when about one to two inches near the flower.

Bees have not hesitated at all or very little when going from one flower of a certain color to the flower of another color of the same kind of flower.

Brooklyn, N. Y.

OTTO REINER.

PROPOLIS MIXED WITH WAX.

I have to contend with a great deal of propolis here when extracting. I scrape it off the frame before uncapping, and it goes right in with the cappings and through the solar extractor. I wish to know if it mixes with the wax and thus renders one liable to the penalty of adulteration under the new law; and if so, how can it possibly be avoided where there is much propolis?

ARIZONA.

[If the wax from the solar ran out in a very small stream, or in drops, it would chill before any propolis could have a chance to settle. Under such conditions, therefore, or when, for any reason, the propolis is mixed with the wax, the whole mass should be heated just above the melting-point of the wax, and cooled slowly, so that the propolis may settle.—ED.]

LIGHT ITALIANS GENTLE.

Every now and then I see you are not in favor of the light-colored bees. People that see my bees and what I am doing with them are surprised. A good many say they can't do what I do. I have bees that I handle with my sleeves rolled up, and bareheaded.

D. E. BEST.

Best, Pa.

[Not all strains of yellow Italians are cross by any means; but it has been our experience and

observation that most of them are. Not only that, but some of them are short-lived, and poor honey-gatherers. The trouble is, the rage for color is apt to overlook some other desirable qualities.—ED.]

AN ENTRANCE-CONTRACTOR THAT CAN NOT BLOW AWAY.

I use a bottom-board with $\frac{3}{4}$ -inch cleats on the front, tapering down to $\frac{3}{8}$ at the back of the board, making an entrance $\frac{3}{4}$ by the width of the hive. This size is used on good colonies for June, July, and August, and also for the winter months while in cellar. When I wish to contract the entrance I use a notched stick held in position in front of the hive by a super spring. This is fitted between two small blocks $\frac{5}{16} \times \frac{3}{4} \times 2\frac{1}{2}$, fastened to the hive with two screws which hold the spring firmly. This entrance-block is cut out on one edge $\frac{3}{8} \times 4\frac{1}{2}$, on the other edge $\frac{3}{8} \times 8$. This is similar to the plan of E. H.

Clare, p. 235, although I use one spring and one block which will stay in position. Neither wind nor chickens can remove it.

A $\frac{3}{4}$ entrance suits me well in summer, and for cellar wintering; and in fall or spring it can be changed in an instant without hunting for entrance-blocks.

A. TIEN.

Falmouth, Mich.

[The contractor here shown is simple and good. The ordinary hive super-springs would answer very well to hold the contractor in place. But such things would interfere with putting on Alley traps should their use be deemed necessary at any time.—ED.]

OUR HOMES

By A. I. Root

If the Lord delight in us, then he will bring us into this land, and give it us; a land which floweth with milk and honey.—NUM. 14:8.

Dear friends, I want to tell you a story that I have told once before. I want to tell it again because it has a new significance just now; and I am also reminded of some things that I omitted in my first narrative.

About the year 1874 (over thirty years ago, you will see), when I was very busy one morning planning my article for the A B C book in regard to bee-hunting, a good-looking well-dressed stranger came down to my home. I looked him over and concluded he was a traveling man who had something to sell—probably something for jewelers. My store had just been burned out, so I was for the time rather out of the jewelry business, and my mind was all taken up with bee culture. These runners are very bright fellows, as some of you may happen to know, and sometimes it is not very easy to put them off. This fellow was much interested in bees or (at least so I thought) he pretended to be. He asked a great lot of questions, but just then I had not time to answer them. He did not seem at all hurt, even if I was somewhat rude to a stranger; and when I tried to excuse myself by saying I had employed a man, a veteran "bee-hunter," to go out in the woods hunting bees, he with great readiness proposed to go also. I hope he will forgive me when I say that on that particular morning I did not really want him along. If he kept asking questions as he had been doing I could not well give my whole attention to the bee-hunting and write it up in good shape for the A B C book that was just then in embryo. By the way, let me digress a little.

At that early date I had learned that a teacher must *know* what he is talking about. We had agricultural papers published then (may be some of them now) by city editors who thought they could instruct the farmer by just sitting in their nice offices and not going out over the farm and through the woods at all. No wonder farmers were disgusted with book farming and farm papers. Well, I had decided that I would not write a thing for that A B C book until I had been right on the spot and been through it, and had seen the things I wrote about, with my own eyes; and that is exactly why my A B C book and GLEANINGS IN BEE CULTURE took hold of the people, and took such "root" and *grew*.

Well, this city chap with his nice clothing went along. I think he was rather fleshy at that time, even if it was over thirty years ago, and I concluded he would soon tire out and go back to town. But he did not, even if it did make him puff and sweat somewhat to climb over logs and follow the line of the bees. I do not now remember very much about what happened that day, as it was so long ago. But two little incidents impressed themselves on my mind while we were out there in the woods. I was interested in music at that early day, and I had been taking lessons on an instrument. While out in the woods I began whistling one of the exercises I

had been going over on the keys during the morning. As this simple little exercise was running through my head I kept whistling it over and over. Finally this city chap remarked that the little melody I was whistling *was* rather pretty; and when he finally added, "I am glad you like it, for it is one I composed," I stopped abruptly and turned around and looked at him. He looked remarkably innocent; but I made up my mind that he was only a "runner" and said this in order to get into my good graces and sell me something or other. I think I was too polite to tell him frankly what I thought of his statement. He was very much interested in bee-hunting. When we got home, although I had enjoyed my visit with him, I rather hoped he would stop at the hotel. But he did not. He came on down to our house. Then he wanted to see my music-book, "Root's Curriculum." I brought it outdoors and let him see it. Near the title he pointed to a star. At the bottom of the page he called my attention to a line of fine print. This fine print read, "Composed and arranged by Dr. C. C. Miller." I did not catch on, even then. Finally he pointed his thumb toward himself and said, "That's me. I am Dr. C. C. Miller. When I told you out in the woods that I composed that little refrain you did not believe me, and thought I was just bragging."

About that time I think I put out my hand and said, "Dr. Miller, I humbly beg your pardon. I meet so many men who take up a lot of my time before I find out they have got something to sell or some investment they want me to go into, that perhaps I am a little suspicious. I hope you will forgive me."

Then I invited our old friend into the house, and introduced him to Mrs. Root and the Rootlets. I think, however, I could not quite get it out of my head that he had some purpose that had not yet come to light. During the evening (for he stayed that night with us) he sang quite a few beautiful hymns; and one especially among them that I shall remember as long as I live; in fact, I believe I shall be glad to hear it sung when I come to die. It was the hymn called "The Rock that is Higher than I." By the way, if it should ever be your good fortune to meet Dr. Miller, by all means have him sing that old hymn for you. Well, before Dr. Miller left us (I think it was at family worship next morning, for about that time we had become well enough acquainted with him to invite him to ask a blessing at the table, if nothing more), I began to urge him to stay longer, instead of hoping he would go away, as I did 24 hours before. Then he said something like this:

"Mr. Root, I *have* been deceiving you somewhat. It *is* true, however, that I am greatly interested in bee culture, and I have been longing for the time when I could have a little home of my own, and do nothing but stay at home and keep bees. I have questioned you a great deal as to the possibility of a man's making a living by bee culture alone. You think it somewhat doubtful—at least until the man has had years of experience. Now, nothing would make me happier in the way of obtaining a livelihood than to be able to secure even moderate means, and be with my wife and family and my bees. I am hoping and praying that this may be brought

about. And now I will tell you frankly that there is one other thing that is even dearer to me than bees and bee culture—yes, of even more account, in my estimation, than a land flowing with milk and honey. I have been reading your writings in the *American Bee Journal*, and later in the *GLEANINGS*, that has been so well started. I see that you have the rare gift of interesting humanity. You love rural occupations, and God has given you the faculty of making others love the open air and the great broad fields as you do. Now, I want to see your influence, your zeal, and your peculiar gifts employed in winning souls to the Lord Jesus Christ as well as leading mankind to love outdoor work and rural employments, and that is mainly why I came here. I have hoped and prayed that something might happen to give me a glimpse of your home life. I knew you felt somewhat annoyed, but I felt there was something at stake, and I (for once in the world at least) crowded myself into a home where perhaps I was not wanted—that is, until you people knew me better. God has answered my prayer. I have had here one of the pleasantest visits of my life. You can not know or tell how I have appreciated this. And now I am going to arrange my business and my plans so as to be a bee-keeper and stay at home instead of being a traveling man for a great music house, and I want to keep in touch with you if you will not think I am asking too much."

There was some more conversation, that I can not recall, about making the Lord Jesus Christ my confidant and my friend. I tried to excuse myself by saying that I was not hostile toward Christianity; but my new friend said, very emphatically and solemnly, "He that is not for me is against me." Then he reminded me that not once in my writings in the *American Bee Journal* or *GLEANINGS* had I intimated or recognized the fact that the Savior of the world has claims on each and all of us. I accepted his friendship just then, but I did not accept Jesus Christ as the son of the living God until some months afterward. Since then I have thought of the way in which Moody and Sankey were received when they went over into England about that time. Our friends across the water were suspicious of the Yankees, and God knows they had reason to be; and when the story was started that Sankey was the agent for the little organ he used to accompany his singing, he was obliged to reply publicly, and assure the people that he had nothing to sell—that his sole business in going from America to England was to offer salvation as a free gift. "Ho, every one that thirsteth! Come ye to the waters; and he that hath no money, come." When the people were really satisfied that there was no appeal coming in for their money, they accepted him, and a great work followed, and Moody startled the world by showing that at least *one man* actually refused the money the people wanted him to take. Both he and Sankey might have become millionaires, but they did not want it and did not take it. Dr. Miller was getting what we considered at that time a large salary. I told him he could expect nothing like it in the way of bee culture. He said he did not care for a big salary, and did not want it. When I read that little Straw on page 1303 about living for a whole week on 35 cents' worth of boiled wheat, I thought

of what he said about living a humble life with his bees. And now after all this preamble I want to have a little talk directly with our veteran friend. I think I shall have to call it an open letter to Dr. Miller.

Dear old friend, when I first saw that Straw on page 1303, about your wonderful yield of almost 20,000 sections from 129 colonies, I wondered if you remembered a conversation that you and I had on that morning when you went back to your work as a traveling man. We both had high aspirations for the outcome of bee culture; but I for one never expected you would ever make any thing like that which you have already reported. Of course, you have said repeatedly, while God has been blessing your labors, "Praise God, from whom all blessings flow;" and verily he has fulfilled the promise found in our opening text in helping you and me both to make this "a land flowing with milk and honey." I can hardly understand it now. When I made you a visit some years ago you were getting a great yield of beautiful white honey, and you said you actually could not tell or suggest where the bees got it. God sent it; and in this journal for Nov. 1, when I saw your statement of from 200 to 276 sections to a colony, I wondered again many times if you said, "Praise God, from whom all blessings flow." Then the figures you give there contain some lessons. If a queen, at least sometimes, is so valuable at two years of age, is it not true that a Leghorn hen (begging your pardon) may be valuable at two and three years of age? One moral is, that we must not go to killing off our queens or biddies just because they are *two years old*. But we should try to adopt some means to let the actual record (trap nesting), and not the age, decide how long to keep them; and the same with humanity. Let the record, not the age alone, decide in regard to a man's fitness for an important office.

I was wondering if you could not be induced to start in with Terry and me for not only a long life but a useful one. You have already, dear old friend, by your long years of experience, saved many a youngster from useless blundering. Of course, we old fellows have a good opinion of the value of our past experience; but there are plenty of younger ones all around us now who can with loving hearts guide and direct *our* footsteps while we are getting feeble from old age. God bless the younger ones; and may he help us to be ready, when it shall seem best for us, to stand out of the way and give place to the younger ones. I am sure they will always be ready, at least to stop and consider what we say, when we assure them they are going wrong. I for one rather *enjoy* growing old, especially when such friendly greetings cheer me, not only in my home, but in my writings. You say on page 1303 there are three reasons for your great success—"forage better; bees better; better bee-keeper." I wish these younger ones and everybody else would remember that your success stands back of you to *emphasize* the value of your opinion on almost all points in bee culture. I think I said recently, "May God be praised that he has permitted me to live and be in touch with such men as Edison, the Wright Brothers, Moody and Sankey," and last, but not least, with such a man and such a teacher as my dear old friend *Dr. C. C. Miller*.

TEMPERANCE.

"JOHN ALWAYS WAS A GENEROUS FELLOW."

BY EDWARD F. BIGELOW.

Evidence 1.—I sat by John at school on the old slab bench. The teacher's eye was sharp and voice was stern. We watched him furtively till, selecting the time when his face was turned toward "the board" to explain some difficult problem, we cut a sly caper. Now we "fired" a paper wad, raising a quickly smothered laugh from the opposite corner; then we held up briefly a jumping jack, and, later, John (with truly artistic spirit) drew a cartoon of Sam and the teacher at the board. Then John and I would dive beneath the desk, and he would share with me his luncheon apple. Thus did John and I while away the winter's day at school to the delight of our companions. John always was a roguish, chummy, generous fellow, but he set a pace in merry play that I could not follow.

TWENTY YEARS LATER.

Evidence 2.—For a score of years I wandered far away from the old farm, but John moved nearer to the village, and there lived on. In a mood that longed for boyhood days again, I visited the old schoolhouse. The walls were neglected; strange trees were growing where bushes had been; but the trees that I had known had become smaller. There was not a child that I recognized; but Alice, the teacher, greeted me as cordially as when she spelled the words I missed, twenty years before.

"And how are your father and Aunt Sue? I remember the walnuts she gave me."

Alice sighed and shook her head sadly. "Father isn't very well; Aunt Sue (didn't you know that?) died two years ago."

"But where is John, my chum?" I inquired. "He used to write to me occasionally, but for a dozen years I have lost track of him."

"John," said Alice, "is his own worst enemy. He can't keep what he earns, but spends it all with boon companions in the barroom. He has too large a heart. John always was a generous fellow."

TWENTY YEARS LATER STILL.

Evidence 3.—Again I wandered into scenes afar, till at the end of another score of years a similar longing led me back to the little village. Only Uncle Eben knew me. He still keeps the corner store, where I had tugged out supplies to the farm wagon forty years before. How short a time! how long a time it seemed! Uncle Eben laughed heartily, and his grey beard bobbed up and down as did a brown one forty years ago. "Goin on eighty," said he; "pretty near time ter call the job done. But you," he said, "how fast you have grown taller!" But this seemed not to me surprising. If one is ever to grow tall, it should be within forty years I think.

"But what are those boys doing out there?" I inquired.

"They're plaguing John—get him so mad—pull his coat and punch him; but, say, you know John—why, John went to school with you out on the hill—poor John! He gets so 'full' it is a pity."

"John!" I exclaimed, and up the walk I hurried. And this old drunkard! I'll ask him where is "John," Jumping Jack John, among those plaguing boys. But this was my first thought—forty years—can it be that the drunkard is John? I'll try to see, so I took up the shout of the boys, but with a far different accent, "John! hey, John! they say you are John—don't you know me?"

But, no; it can't be my John, for he reeled backward on the walk and against the tree, bracing himself there, muttering in maudling, drooling, leering tones, "Well, what do you want, with all the others? I—I—s-a-y, you go t' hell, will you?"

"John always was a generous fellow."
Stamford, Conn.

[Let me say to our readers that it made my heart throb when I saw something from Prof. Bigelow, written for my temperance column, and I want to call attention to the fact that the above is not only a grand temperance talk, but it is a *boiled-down* story. I am beginning in my old age to recognize that one of the indications of a great mind is the ability to tell much in few words, and Prof. Bigelow has done it. Most of us who have lived to be toward threescore and ten have had the same experience in meeting some old friends of our boyhood. May God grant that the record of the next generation shall tell a different story.—A. I. R.]

OHIO SHALL BE FREE.

At the present writing, the counties in Ohio are going dry at such a rate that one can hardly keep track of them. Big cities that have been literally intrenched in the saloon business have been made dry by the rural residents, even though the brewers put in their money and left no stone unturned to hold their trade. On page 1332 I gave a little clipping of the way in which one of our bee-keepers and honey-men heads his advertisement. Here is something more from our enterprising young friend:

Mr. Root:—Confirming my telegram of last night, it is my very great pleasure to inform you that Muskingum Co. voted "dry" yesterday by a majority of 1116. While the city went wet by a little over 1400, this was overcome by the vote of the rural districts. The wet majority in Zanesville was less than that conservatively estimated by the dries, while the dry majorities in the country exceeded expectations. Our temperance organization was well nigh perfect; and, in spite of thorough organization, stubborn resistance, and an immense corruption fund freely expended, we have, with God's help, won a glorious victory. One of the most gratifying results of this election is the breaking of the backbone of the Republican-Liquor organization—one of the most corrupt aggregations that ever dominated county politics.

EDMUND W. PEIRCE,

Zanesville, O., Nov. 17. Dealer in bee-keepers' supplies.

THE SALOONS AND TAXES.

Just now not only in Ohio, but more or less in the whole United States, there is war between the brewers and the Anti-saloon League workers. The strongest argument that has been brought forward by the saloon is that they *help pay our taxes*. The following, from the *Ohio Farmer*, is one of the best answers I have ever seen to those who really think that the open saloon is of some benefit in this way.

SALOONS INCREASE THE TAXES.

Because the liquor forces are flooding Ohio counties in which local-option elections are pending with warnings to voters that their taxes will be increased if they vote out the saloons, and

with arguments that the saloon taxes pay the poorhouse bills, etc., we wish to present the following facts for the especial consideration of any who may be likely to be misled by the fallacy of their arguments. There are not many public-spirited farmers who would not far rather pay more taxes to get rid of saloons if that were necessary. But it is not necessary. Instead, the absence of saloons and of the necessary means of controlling them and the disorder that they create, and of relieving the distress that they cause, has cut down the expense of every community that has voted them out. Read this testimony: Newcomerstown, O., reduced its tax rate 4.5 mills within three years after going dry. Athens, O., reduced its rate 8 mills in one no-saloon year. East Liverpool, O., 1.2 mills in one year. The mayor of Brunswick, Ga., says: "The decrease in crime since the passage of our prohibition act has been at least 80 per cent in this city." The sheriff of Oklahoma Co., Okla., in which the capital city, Guthrie, is located, says: "Since the anti-saloon act took effect, 60 per cent of the crime has ceased." In Knoxville, Tenn., as the result of no saloons, the salaries of the public-school teachers have been materially increased, and the school fund increased from \$63,000 to \$106,000. Comparison of arrests for drunkenness under "wet" and "dry" regimes are convincing. In Galesburg, Ill., during June, 1907, with saloons, the arrests were 113; in June, this year, no saloons, there were only 15. In Haverhill, Mass., during "wet" May, 1907, there were 91 arrests; this year, "dry," only 15. In Atlanta, Ga., during "wet" January last year there were 341 arrests; this year, only 64. An East Liverpool, O., business man wrote recently: "With 53 saloons we had not enough money to feed prisoners or purchase new collars for the east-end fire-station horses. With no saloons we have equipped a new fire-station at the west end, furnished free text-books in all our schools, and made provision for a purer water supply, yet our tax rate for the ensuing year is lower." Remember that the court and police and poverty-relief costs of saloons always exceed the taxes brought in by them, to say nothing of the greater cost caused by the destruction of manhood, morals, thrift, and industry.

PERSONAL LIBERTY; THE AMERICAN FLAG, ETC.

Dear Sir:—Being a regular subscriber to GLEANINGS, I should like to make some suggestions in my way of thinking on some of the topics in your temperance columns. As for myself, I do not like them at all, and can't see any thing in them but a lot of trash, and think that, when you issue a bee-journal, you should stick to the bee industry alone, and give your readers what they are paying for—a bee-journal and not a political or religious magazine. I don't doubt that you are sincere in your convictions on the subject, but that does not justify you in letting your private opinions interfere with your business journal.

I have to-day read your issue of Sept. 15, and in our Homes you quote a lot of sayings from other men, and therefore I think that you indorse the same; for instance, a religion that leaves the saloon undisturbed is not worthy to be called after the name of Jesus Christ. You don't seem to know, or have forgotten, that Jesus was supposed to have made wine out of water; also another one—that, no matter whether a man be rich or poor, white or black, educated or not, he has the same chance and gets a square deal in this glorious country of ours. Now, you don't believe that yourself, do you? Certainly not; then why do you print such trash as that, and expect any man with only an excuse for a brain, to read any thing like that? As for myself, you need not think I am a drunkard; but I do take a glass may be once every two weeks, and should object to any man taking my personal liberty away from me and telling what to drink. Hoping you will excuse my criticism I remain,
EDWARD FRITZSCHE,
Richmond, N. Y., Sept. 2.

Thank you, friend F., for your frank and honest criticism. Yes, it is true that my temperance and other talks come in a bee-journal; but if you will look on page 1106 of the journal you allude to you will find that we announce in every issue that our journal is

"DEVOTED TO BEES, HONEY, AND HOME INTERESTS."

In regard to this matter that has been so much discussed for ages, about Christ turning water into wine, I think the general decision has been that Jesus never offered any intoxicating drink to anybody. We have now what we call "wine" in our own cellar; but it is the pure juice of the grape, without any fermentation whatever, and is what is sometimes called "communion wine."

In regard to keeping wine or beer in your own home, and taking a glass say once in two weeks, as you suggest, the Anti-saloon League (of which

I am proud to say I am a charter member) has never undertaken and does not undertake *now* to dictate what you shall eat or drink in your own home. We have nothing whatever to do with that, although the brewers and saloon-keepers have often brought the matter up as you do. It is against the open saloon as it is now managed that we wage war. The contrasts between towns and cities where they are run with saloons and without saloons, that are now being published, with the facts and figures from all over our land, is, I think, a sufficient reason why saloons should be put out of business, just as you see has been done by our victories of late.

Last, but not least, you quote what that poor foreigner who came to our own country says in regard to the American flag. That was his statement. It is our privilege, every one of us, to decide whether the American flag does mean all that or not; and I think you will agree with me that, at least as long as you continue here in America, the American flag *should* mean, "A square deal to every one, no matter whether he is rich or poor, black or white, educated or uneducated." If it does not mean all that just now, will you not, dear friend F., make it your business to join hands with the rest of us and *make* the "stars and stripes" really *mean* just what that poor man said they meant to him. May God bless and enlighten you and all others who feel as you do about the work that is being done just now in the way of banishing the saloons.

Just a word in closing. While I have had kind words in almost every mail for months past in regard to my temperance talks, there have not been half a dozen who have taken the position that you do; and there was just one other person who threw it into my teeth that the American flag does not mean what I seemed to imply it meant. This person lives in Canada. He said that the statement that you have referred to in regard to the American flag was a lie, and that I knew and that Bishop Wilson knew it was a lie. This brother did not sign his name to his letter, and so I could not reply to it. But I happen to know, however, that he is by no means a fair representative of our Canadian brethren.

HOW THE POPULAR MAGAZINES ARE GOING DRY.

November 29 was the World's Temperance Sunday, and among other good things in the *Sunday School Times* for that date was an article headed "How the Popular Magazines are Going Dry." It seems there are about 60 different magazines published now in the United States; and of these they give a list of 40 that declare boldly:

We do not publish any advertising matter pertaining to intoxicating liquors. This publication will not lend itself as the medium to introduce into the family circle habits other than good.

May the Lord be praised for the above decision. Quite a number of the remaining 20 say they have not yet made up their mind, or do not know exactly where to draw the line, or something of that kind. This list does not include the agricultural or other class papers; but may the Lord be praised *again* for the fact that our agricultural and rural periodicals, nearly all if not quite all of them, are taking a *higher* moral stand, if any thing, than the magazines, and higher than a good many of the religious periodicals. Now, if

we could have just one daily paper—that is, a daily published in some of our large cities like Cleveland, that would rule out whisky advertisements, I should have great faith in the theory that the world is growing better. It is true we have excellent temperance editorials in these same papers; but what do you think of a paper and its management when we are told by our highest medical authority that intoxicating liquors in any form are always dangerous and harmful, inducing pneumonia, consumption, and allied diseases, and then be told in the advertising columns that Duffy's malt whisky is the *best remedy in the world* for the same disease? These editors know perfectly well that the whisky advertisement contains the vilest falsehoods, and yet they keep filling their columns so long as the money is forthcoming to pay for them. Now, is it not time for the people at large, who are working so hard for prohibition, to declare that they will tolerate no periodical in the home circle that advertises whisky or intoxicating medicines—not even the *daily paper*? God speed the time when this may come to pass.

DRUNKEN CHAUFFEURS.

The clipping below seems to fit certain conditions very well. I think it might have a conspicuous place in GLEANINGS with an editorial footnote on the extenuation plea. Boston surely deserves the chromo. It has got to be too common that one guilty of misdemeanor and murder pleads insanity or the *drunk*, expecting leniency, when, in fact, the punishment should be doubled, as they were drunk. An intoxicated young man should not be allowed on the streets. It is a disgrace to a town to have a boy drunkard.

F. DANZENBAKER.

Norfolk, Va., Nov. 4.

PROGRESS OF CIVILIZATION.

In Boston they seem to have solved one of the problems of modern civilization. A speed maniac there was sent to jail for six months for reckless driving of a machine. When he pleaded as extenuation that he had been drinking he was in addition fined for intoxication.—*Baltimore American*.

Amen to your suggestions, friend D. I have wondered whether some of these distressing accidents, if not most of them, that have resulted in the loss of life, were not caused by drink. There certainly should be some strict and severe laws in regard to permitting any man, even a *moderate* drinker, from running an automobile, no matter if it belongs to himself or to somebody else. Such a man might in some ways do even greater harm to society in general than a drunken engineer on a locomotive. If there are no laws in regard to the matter, let us quickly get about it and frame some. And I heartily agree with you in your closing sentence, that every town and every community is disgraced by the spectacle of a single "boy drunkard" on the streets.

A "RED-HOT" TEMPERANCE LETTER.

Dear Friend Root:—Praise the Lord! My telephone-bell just rang; and on going to it my cousin in town said, "The local-option bill has passed! The bells are ringing! That is all we know." But it is enough! I suppose she means the De Pauw University and church bells are ringing, as they well may. Praise the Lord! At last we are freemen, and can go to the ballot-box and vote prohibition for our counties. Our hands have been tied these many years; but now we've got the Devil by the nape of the neck. We'll chuck him into the machine, and scrunch him like a pea between millstones! Theimps of hell, the sons of Belial, or whatever you please to call the villains who have been selling liquid damnation, will be driven outside the camp into the wilderness. Praise the Lord! If any repent and forsake their sinful calling, they will be allowed to go to work and become honest, respectable men; but if they do not they will be kicked into some less intelligent community or thrown into jail. The saloon is doomed! Shout it from the housetops! At last we've got the ballot in our hands, and the saloon is doomed! Every good citizen is delighted. Of course, we have a long and

bitter fight before us. Evil, like thistles and burdock, will never be exterminated until the millennium. But constant care and hard work can keep our fields reasonably clean.

Governor Hanly deserves great credit for calling the special session and forcing the bill through the legislature.

Recently Bishop Matthews, of the United Brethren Conference, nominated Hanly for President. I believe you have done the same. Go ahead! I am with you. DANE S. DUNLOP.

Greencastle, Ind., Nov. 11.

"CHURNLESS" BUTTER MADE IN ONE MINUTE, ETC.; THE GREAT \$5.00 SECRET.

We have had the "fireless" stove, the "lampless" brooder, and now we have the *churnless* butter. Some of the agricultural papers (I am glad to say only a *few* of them) have given a whole double-width column to this "great" invention. Here is the way it reads:

A new patented churnless butter made in one minute. No more work, no more worry. We can give you knowledge of how to make good wholesome butter in one minute. A patent was given by the United States Government for this process, and it had to be healthy and pure.

Now, that last sentence kind o' puzzles me. Is it the United States *government* that has to be "healthy and pure" or is it this wonderful process? We give it up. Below the above is a picture of a pretty girl with a bowl and spoon, making butter "in a minute." A little further down is a barefooted boy working an old-fashioned churn. And, by the way, why in the world *should* people fuss with churns of any kind when we can make better butter in one minute without any machinery? There can not be any hook or crook in the matter, because the advertisement goes on to say:

This process will not fail. It will do every thing we claim for it; if it will not, we will return the money you have paid us for it. Health officers, dairymen, and scientists have pronounced it excellent.

Now, the price of this wonderful secret for a family right is \$5.00; but the enterprising agricultural paper has made arrangements to send the whole thing for only \$3.00, and will throw in a subscription to their paper for three years. We scraped up the \$3.00, and watched the mails breathlessly (?) for almost two weeks. Finally a single sheet of paper, printed in red and black ink, so as to make it look like a patent-right deed, came to hand containing this wonderful process, and we take pleasure in giving it entire to every reader of GLEANINGS free of charge. I am sure you will all be glad and thankful, especially after you read it over. Here it is:

CHURNLESS-BUTTER PROCESS.

Put fresh milk in suitable vessels to heat well. Heat over a slow fire. When milk has been thoroughly heated (not boiled) set in a cool place where it will get cold. When the cream has well risen, which will take from twelve to twenty-four hours for the best results, take off the cream with as little milk as possible, put in any vessel suitable to make butter in—in this should be left in a cool place until the cream has gotten into a stiff condition. In cold weather the cream should be about 65 degrees. When it is stirred with quick strokes of a common butter-paddle, the butter will be made in about one minute if handled correctly. Wash and salt the same as other butter. In summer time or warm weather the cream should be kept in as cool a place as possible, and always begin to stir as soon as taken from the cool place; the weather being warm, the butter can be made quickly, even when the cream is at from 40 to 50 degrees. If cream is 'too warm' it will become thin and take longer to make the butter, and when made will be soft and oily.

If buttermilk is desired, take the sweet milk after the cream has been taken off, run it in a suitable place to sour just as if you were preparing to churn the old way. When it is in a good clabber state, stir with spoon and make buttermilk of the finest quality. The sweet milk, after cream has been removed, is nourishing and wholesome.

Now, may be I shall get sued and put in jail, or be sent to the penitentiary for violating the patent laws; but the sheet of paper printed in red ink did not tell when the patent was granted. It has no date on it, and just one single signature. If I get put in jail I am sure the great lot of friends I have will help me to get out quick.

CHURNLESS BUTTER—STILL MORE ABOUT IT.

Mr. A. I. Root:—The churnless-butter process is no fake nor humbug, as your friend H. W. Collingwood puts it. It is just what it claims to be, for I have used it since last winter, when I first heard of it. It *does* make as firm good butter as ever came from any churn, and very much better than comes from some churns. It is a labor-saving process. It may possibly have been known long ago, but that did us of to-day no good until some one brought it to our notice. We obtained the process more out of curiosity than because we had any faith in its doing any thing. I now have faith, and lots of it.

MRS. WM. MEYER.

Tecumseh, Okla., Oct. 12.

Well, my good friend, I am very glad indeed to find that one woman, at least, is pleased with her investment; but do you not think it would have been more sensible, and much better all around, to have this simple process (which you admit is probably old) given on the pages of our home journals, just as we have given it, instead of asking each person to pay three or five dollars for the great secret as you have doubtless done?

NAVIGATING THE AIR BY THE WRIGHT BROTHERS AND OTHERS.

The latest report we clip as below from the *Chicago Daily News*:

WINS IN FIVE MINUTES A PRIZE THAT NATIVES HAD BEEN CAREFULLY PREPARING TO CONTEST FOR.

LE MANS, Nov. 14.—"I might as well have that 1000 francs (\$200), even if I don't exactly need it," remarked Wilbur Wright yesterday afternoon after suddenly deciding to try for the prize offered by the Aero Club of the Sarthe department for an aeroplane flying as high as 100 feet. In another half-hour he had shot up into the air on his machine without using the starting apparatus, and soon he soared twice around the big Avours field at a height of fifty feet above the small captive balloons which marked the 100-feet height.*

It took Wright five minutes to win the prize, which several French aeronauts have been carefully preparing to acquire for several weeks past—not for the sum involved, but for what the Aero Club calls "the peculiar distinction of not only flying but flying at high altitudes."

GIVES LESSONS IN FLYING.

Wright is giving the last lessons in flying to a number of different persons, according to his contract. When these are concluded he will go to America via Cherbourg, because in the neighborhood of that seaport there still remains another prize to take—that for the straight-distance flying.

Yesterday's flight, made without using the sort of catapult which has caused so much gossip, has settled the question of the machine's being handicapped for long flights.

We gather from the above that our friend Wilbur has learned the trick of starting without his "catapult" (the starting apparatus I described in our last issue), and, in fact, I rather suspected they would, after they became better acquainted with the machine and its capabilities. The following clippings from *Aeronautics* for November give us glimpses of what is going on in the aeronautical world:

It has been figured that the total duration of Wilbur Wright's 72 flights in France, up to Oct. 15, inclusive, amounted to 13 hours 49 minutes (will it take place "all in one sitting" next year?). Thirty persons have been carried, including three women and a boy, a total distance of 431 miles.

On October 15, two flights were made of 1 minute 38 seconds,

*In a second flight of 11 minutes' duration, Mr. Wright is said to have risen to a height of 196 feet above ground. These are the first official records for height that the American aviator has made.—*Scientific American*.

and 2 minutes 35 seconds, carrying MM. Mercanti and Gasnier. Wright stopped his motor when at a height of 120 feet and made a long smooth glide to earth.

On the 28th Count de Lambert began his lessons as an apprentice-aviator. For his first lesson he had three flights of 12, 8, and 15 minutes. On the following day the master and pupil made three more, 7 minutes and 5 seconds, 17 minutes and 34 seconds, and 19 minutes and 25 seconds.

In a recent interview Wilbur Wright stated that the success of his machine was especially due to the high efficiency of its propellers, that light motors were not essential, and flight could as well be attained with a steam-engine. He claims 70 per cent efficiency for his propellers.

Mr. Franz Reichel, who made the first "hour flight" as passenger on the Wright machine in France, has been the first one to describe accurately the wonderful sensation of human flying. He says: "If in an aeroplane going straight ahead is a delicious sensation, turning is a veritable intoxication. It was during these evolutions that I felt that the air was conquered, well conquered."

It is said that fully one hundred Wright aeroplanes have been ordered from the Societe Navale de Chantiers de France. They will be fitted with Bollee engines and be sold at \$5000 apiece. Count de Lambert and Vicomte de La Brosse will receive the first two. (This seems an "awful lie.")

On the 28th Farman made another long flight and again another of about a mile with M. Painlevé aboard. Following these, other alterations were made and for the first time in the history of aviation a flying-machine traveled from one town to another.

NEW PRIZES—IN FRANCE.

1000 francs by Aero Club de la Sarthe as a height prize, with conditions making it possible for Wilbur Wright to compete (he was excluded from the other prize for height for not starting by his own power only). Captive balloons must be flown over at a height of 30 meters.

First, it is an agreeable surprise, at least to myself, to know that thirty persons, including a woman and a boy, were carried; and the second item declares positively that the machine actually carried *two people* besides Mr. Wright himself. If they would only tell us the total weight of the three persons we could judge a little better of the capacity of the machine for carrying burdens. I am very glad indeed to know that 100 machines have already been ordered, and that the others will be sold as low as \$5000 apiece. That is not any more than some of our automobiles cost; but I do not exactly understand the footnote by the editor of *Aeronautics*. Does the "awful lie" refer to the 100 machines to be built, or to the price, or to the fact that the Count de Lambert and the Vicomte de la Brosse will receive the two first?*

Our last item tells us that Farman is also making progress, and that he too is carrying a passenger; and that he has succeeded, at least to a small extent, in traveling from one town to another. When actual flying-machines begin to traverse the country by going from town to town as automobiles do, then we shall see such a stir throughout the whole wide world as has never been seen before.

My last clipping I have given to explain *why* it was that Wilbur Wright was induced to try *climbing up into the air* without the use of the catapult. Oh! it is not glorious to be alive when so much is going on in the way of invention and progress—not only on the face of the earth, but away up into the beautiful air above us, and, with a prospect in future, of enjoying companionship with the very *clouds* that float above us?

*Since the above was in type I notice by one of the papers that Wilbur Wright has at least once shut down the engine while high up in the air, and made a gradual glide down to the ground in perfect safety. This refutes the statement made by several of the papers that disaster would surely follow in case of the breaking-down of the engine. If I am correct, the engine might be stopped for repairs while up in the air, and, if up high enough, and the repairs did not take too long, the difficulty would be little if any greater than in stopping the engine of an automobile for repairs.

HEALTH NOTES

ROBBING SICK PEOPLE.

The following, clipped from the *American Issue*, explains itself:

WHISKY AND CONSUMPTION.

In an address before the Mississippi Valley Medical Association in Louisville, Ky., on Oct. 15, Dr. T. D. Crothers, of Hartford, Conn., editor of the *Journal of Inebriety*, said:

The so-called moderate use of spirits, which diminishes the vitality and lowers the resisting power of nature, is an active cause of consumption and typhoid fever, and is accountable for over 30 per cent of the cases of pneumonia. In fact, there is no disease known, and no surgical operation performed, that is not influenced and made worse by spirits.

The present efforts of laymen and societies to correct and prevent this evil as a moral one is a sad reflection on the stupidity of the medical profession.

And yet every daily paper published in any of our large cities is filled with advertisements recommending whisky, not only for consumption but almost every other known disease, from Duff's malt whisky for people toward a hundred years old to the Wilson whisky advertised on the waste-paper baskets all over the great city of Cleveland, on which we see advertising urging sick persons to *drink whisky* to make them well. We have as a nation succeeded in stamping out diphtheria and typhoid fever by *compelling* people to use pure water; but what is being done to prevent them from drinking bad whisky, even when this whisky is *worse* than poison? When one dies from typhoid fever he dies an honest, innocent death; but when he dies from the effects of whisky he fills a drunkard's grave. In the latter case, however, his friends do what they can to conceal the fact. Is it not almost time that Christian people, and temperance people too, refuse to take a daily paper or any other kind that parades such terrible falsehoods in regard to the use of whisky for curing disease? How about Chemist Wiley's remarks in regard to misleading and hurtful advertisements?

After the above was dictated I found the following in the *St. Louis Times*:

AD MEN WARNED NOT TO MISLEAD PUBLIC; LAW WILL PUNISH DISHONEST ADVERTISERS, SAYS GOVERNMENT PURE-FOOD EXPERT.

NEW YORK, Nov. 11.—Addressing the members of the Sphinx Club of Advertising Men, Dr. Harvey W. Wiley, head of the Government Pure-food Bureau, warned them that the publication of dishonest advertisements would land them in the toils.

"Let me tell you right now," he said, "that no advertising is honest which makes any misleading statement about the quality or benefits of the goods advertised. I would not like to see any of you brought up before me in Washington for any such offense, but if you continue, I will get you—or, rather, the law will."

Referring to the presence of deleterious compounds in almost all foods, Dr. Wiley said he had revised his morning prayer to read: "Give me this day my daily sins, and forgive me my bread, as I forgive those who gave it to me."

To the above I wish to add, three cheers for Professor Wiley! and let us each and all see to it that the way of the transgressor is made hard. When you get swindled by some misleading and dishonest advertisement it is a Christian duty to have those who deceived you brought to justice.

TROUBLE WITH OUR DIGESTIVE ORGANS.

I wish to suggest that the cause of Mr. Bischoff's sore stomach, as described on page 1272, Oct. 15, is that he is slightly overeating. Let him go without breakfast until 11 o'clock, or noon, and in a week or two his stomach will recover.

If the stomach feels very faint at about 9 o'clock, when doing without breakfast, take a small glass of water and put into it four tablespoonfuls of milk, and honey the size of a hickorynut. Mix them well and sip slowly with a teaspoon. This should satisfy the stomach until 12 or 1 o'clock. Sometimes going with-

out breakfast causes a headache. If the omission of breakfast is continued, the headaches will finally stop.

The best remedy I have ever found for dyspepsia, or the disagreeable indigestion of food, is to eat a piece of raw cabbage at the close of the meal. Eat the stump and some of the green leaves on the outside. Get the cabbage fresh from the garden, and one of the smaller-sized ones, say a head about 4 inches in diameter. Cut it into quarters, and eat about one quarter. Use a little salt if it tastes better. I consider the cabbage a great deal better than any kind of fruit. If we use milk with our meals it should be mixed with four-fifths water, and slightly sweetened with honey. Sugar and bread cause the sore stomachs, most likely. Their carbons are dead.

In regard to the boiled wheat mentioned by Dr. Miller in the sixth paragraph on page 1243, I would say that, if the wheat is soaked through the night, it will boil in an hour or less instead of 2½ hours. After boiling the wheat let it stand in a warm place until it begins to *smell* of fermentation. It should not ferment enough to be perceptible to the taste. Taste and smell are two different things. Then grind it through a mill and boil it in a vegetable soup for five or ten minutes in fitting it for the table. After the fermentation the heat splits up the starch-cells. I have used wheat in this way for years.

Chatsworth, Cal., Nov. 7.

C. W. DAYTON.

The above reminds me that years ago I read that cabbage is more digestible when raw than it is when cooked; and oftentimes when I was running a market-wagon I found a small head of Jersey Wakefield cabbage that had just burst open would often afford me quite a luscious lunch. In fact, I used to put these cracked heads on the table, saying that I preferred them in that way to any of the various cooked cabbage, and this raw cabbage always agreed with me nicely. You see this is a strong argument in favor of "uncooked foods." Raw apples seem to me now to agree with me much better than any kind of cooked apple. I feel sure that most of us will find we can get benefit by using a certain amount of uncooked fruits and vegetables at every meal. And just see what a saving it is in time and fuel for the good wife!

BEE-KEEPERS AND POULTRYMEN; ARE THEY AS A RULE ABOVE THE AVERAGE IN THE WAY OF MORALS AND ABILITY?

It has been many times suggested—at least through the bee-journals—that bee-keepers are as a rule good, clean, and progressive men. I do not remember to have heard, however, that those who are in the poultry business have better morals than the average humanity; but it begins to look a little that way. Mr. J. F. Schureman has just given to the world a little book entitled "Harold Ware." While it is a story-book, and a most fascinating piece of fiction, the author manages to touch on the work of the Anti-saloon League, the labor troubles, both bees and poultry, and through it all to hold up the spirit of the Lord Jesus Christ as we see it exemplified through the hearts of the common people when they happen to get started in the right channel. The price of the book is 25 cents, in neat paper binding, or 50 cents in cloth. Address J. F. Schureman, Marseilles, Ill., editor of *Commercial Poultry*.

Convention Notices.

The Colorado bee-keepers will hold their annual convention in Denver, at the American House, corner of Sixteenth and Blake, Dec. 8 and 9. Program later.

N. L. HENTHORNE, Sec.

A meeting of the bee-keepers of Eastern Illinois and Western Indiana will take place at the court-house in Watseka, Ill., Dec. 15 and 16, at 10 A.M. A good program is prepared. A question-box will be provided. Other business will be taken up. All interested will please attend.

Paint Without Oil

Remarkable Discovery that Cuts Down the Cost of Paint Seventy-five Per Cent.

A Free Trial Package is Mailed to Every One Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powderpaint. It comes in the form of a dry powder, and all that is required is cold water to make a paint weather-proof, fire-proof, and as durable as oil paint. It adheres to any surface, wood, stone, or brick, spreads and looks like oil paint, and costs about one-fourth as much.

Write to Mr. A. L. Rice, Manufacturer, 9 North St., Adams, N. Y., and he will send you a free trial package, also color-card and full information showing you how you can save a good many dollars. Write to-day.

For Big and Quick Profits.

Ten years experience enables me to give practical instructions that will add \$5 to \$50 per week to your income without interfering with regular occupation. For full particulars and free book, address **JACKSON MUSHROOM FARM,** 3404 N. Western Ave., Chicago, Ills.

FREE

To prove that our “Blizzard Belt Evergreens” will grow in all parts of the country we offer to send 6 fine Spruces $\frac{1}{2}$ to $\frac{1}{2}$ ft. tall, free to property owners. Wholesale value and mailing expense over 30 cents. To help, send 5 cents or not as you please. A postal will bring the trees and our catalog containing many colored photo plates of our choice Blizzard Belt Fruits, Ornamentals, etc. We want to get acquainted with you and it will pay you to get in touch with our Hardy Blizzard Belt trees. 39 years' experience in growing hardy trees here in what was once called the Great American Desert. Write today.

THE GARDNER NURSERY CO., Box 26, Osage, Iowa

Texas Land \$1.00 To \$5.00 Per Acre

Texas has passed new School Land Laws. Millions of acres are now to be sold by the State at \$1.00 to \$5.00 per acre; only one-fortieth cash and no more to pay for 40 years, unless you desire; only 3 per cent interest. You can buy 160 acres at \$1.00 per acre, payable \$4.00 down and 40 years' time on the balance, 3% interest. Greatest opportunity ever offered to investors and farmers. Texas land is better than Oklahoma, Iowa or Illinois. Send 50 cents for Book of Instructions, New State Law, Map of Texas, and brief description of over 400 million acres of vacant public lands in 25 different States, which are open to homestead. Three Books for \$1.00.

E. C. HOWE, 938 Hartford Building, CHICAGO, ILL.

VIRGINIA FARMS

As low as **\$5 per Acre**

with improvements. Much land now being worked has paid a profit greater than the purchase price the first year. Long summers, mild Winters. Best shipping facilities to great eastern markets at lowest rates. Best church, school and social advantages. For list of farms, excursion rates, and what others have accomplished, write today to F. B. LABAUME, Agr. and Ind. Agt., Norfolk and Western Ry., Box 50 Roanoke, Va.

YOUR HIDES AND OUR HIDES

MADE INTO WARMTH FOR THE WHOLE FAMILY

We are the largest firm in the country that tans, manufacturers and sells all kinds of fur goods direct to the consumer. Our beautiful catalogue tells you how to get the best fur coats, robes, neckpieces, ladies' jackets, children's coats, fur-lined coats, etc., made to order, saving for yourself the jobbers' and retailers' profit. Our stock of hides and skins is complete. We furnish the material and manufacture to measure for fur goods; physicians, etc., and their families, all varieties of fur goods; or we will tan, any kind of skins, wild and domestic, you send and make them into furs for any member of your family.

Don't sell your hides or skins. It's poor economy. Send them to us and have them made into coats, robes, mittens, jackets, ladies' furs, etc., and keep your family warm this winter. Any color horse or cow hide looks well. Our process makes them soft and pliable, also mothproof and waterproof.

No Matter Where You Live We Will Pay the Freight On
All Hides Sent to Us to Be Made Into Coats or Robes

FREE:—With each cow or horse hide coat or robe made from hide furnished by you, we make free for you a pair of knit-lined mittens with horse-hide palms. Hear what Mr. Chestnut, Straw, Mont., says: I received the overcoat made from the hide I sent you. It is surely a dandy and those mittens made to match overcoat are all right. I am highly pleased with the goods.

You'll feel the same when you deal with us once. Send for new, handsome catalogue and learn all about our money-saving methods. Write today.

National Fur and Tanning Company.

ROCHESTER, OHIO.

HILTON'S Strain of Bees and What They Did

Dear Friend Hilton:—The two three-frame nuclei I received of you May 21 were received in fine condition, and the red-clover queens proved themselves worthy of the name. I never saw finer or gentler bees. They were transferred to ten-frame hives and full sheets of foundation. I now have four strong colonies, with plenty of stores for winter, and have taken 195 lbs. of fine extracted honey, mostly clover. I want two more nuclei for next spring delivery, and my neighbor wants another. You may use this letter or any part of it as you choose.

Gratefully yours,
Rhinelander, Wis., Sept. 14, 1908. G. C. CHASE.

In addition to the above I have sold friend Chase about \$200 worth of ROOT GOODS, which deserve some credit for the above results—the best of every thing is none too good. ROOT'S GOODS and GLEANINGS helped. If you are not taking GLEANINGS, WHY NOT? For an order of \$10.00 before Jan. 1 I will give GLEANINGS one year; \$20.00, two years; \$30.00, three years; or you may have GLEANINGS from now to the end of 1909 for \$1.00; two years for \$1.50; three years for \$2.00. SEND FOR MY 40-PAGE CATALOG. CASH FOR BEESWAX, or will exchange goods for it.

NEW STOCKS

During the season just closed we have, on account of the unusual demand for our supplies, reduced our stocks to a minimum.

VISIT TO THE FACTORY

Knowing so well the requirements of the bee-keepers of the South, I decided to visit the factory of The A. I. Root Company and personally select our stock for the coming season. This I am now doing, and will be back in San Antonio to give personal attention to the trade shortly after this announcement appears. While our goods have always been of first quality, this personal selection will assure even more uniformity than ever before, and I want to say to my bee-keeping friends that, while I am well acquainted with all of the leading lines of bee-keepers' supplies, I have never seen any thing equal to the quality of those which I now have.

JOB LOTS

Notwithstanding the reduction of our stocks as above noted, we have on hand a few desirable lots of shipping-cases and a few other goods for which we have but a very limited demand in the South; and, rather than carry these in stock, we have decided to close them out. We refer intending purchasers to the list of shipping-cases published in the November 1st issue of GLEANINGS, page 1337. For further description of these and similar goods, write us.

HONEY-CANS

As usual, we are prepared to supply all styles of honey-cans in all sizes, and solicit your inquiries and patronage. Our contracts with the factory enable us to furnish these at lower prices than any other Southern concern, and the quality is the best.

WEED FOUNDATION

It will be remembered that we have a full equipment of Weed machinery, so that bee-keepers having large lots of select wax which they desire worked into foundation by the pound can have it done at San Antonio, and save heavy transportation charges. We also furnish the same at the usual catalog prices. While on my visit to the factory I have selected additional machinery to keep our equipment up to the best.

Soliciting your continued patronage I am yours truly,

UDO TOEPPERWEIN.

TOEPPERWEIN & MAYFIELD

1322 South Flores Street

SAN ANTONIO, TEXAS

FASHION BOOK FREE!

I want to send you my handsome new book showing hundreds of latest styles with illustrated lessons on cutting and dressmaking. I will agree to sell you all the patterns you want for five cts. each. They are the same patterns you have always paid 10c & 15c for at the stores, made by the same people, and correct in every detail.

HOW I DO IT.

I publish the **FARMER'S CALL**, a weekly paper for every member of the family. An especially interesting feature each week are the children's letters; and the Woman's Department is unusually strong and instructive. Among the special features for Women folks, is its fashions in which I show the **5c patterns**. Let me help you to save money.

MY SPECIAL OFFER

Send me 25c and I will send you the **Farmer's Call** every week (over 1000 pages) for one year and will send my big Fashion Book to you free. I also agree to sell you any pattern you want thereafter for 5c. I can sell them for 5 cts because I buy them by the thousand and don't make any profit. I don't want the profit. I want your subscription to the **FARMER'S CALL**. You will save many times the cost of my offer in a year. **WRITE TO-DAY!**
JOHN M. STAHL, Dept. G, QUINCY, ILL

Flower Language Post Cards FREE

A series of 12 beautiful cards

TO YOU

Do you know the language the flowers talk? Here is a wonderful series of twelve beautiful Flower Language Post Cards that I will send to you absolutely free. Only send me ten cents for a six month's trial subscription to my big 24-page journal, **THE GLEANER**, which is of interest to every member of the family, and I will send you all twelve of these beautiful cards absolutely free as a present. Each card portrays a different cluster of life colored flowers arranged in artistic designs reproduced from paintings by J. Leslie Melville. Each card has a beautiful poem written by O. Preston Wynne, revealing the language of the flowers in verse. Think of it.

12 Beautiful Post Cards

and **THE GLEANER** for six months on trial for only 10 cents and **REMEMBER** that if you will write me at once I have a surprise for you. Don't forget to ask about it. Don't lay this down and say "I'll send for these tomorrow;" **WRITE RIGHT NOW.**

Shipping-cases

for any number or size of sections desired. These cases are made of fine white basswood, and the workmanship is first class. Owing to the shortage in the honey crop last year we have a good stock on hand and can make immediate shipment.

Twelve-inch case, with follower, to hold 24; or eight-inch case, with follower, to hold twelve beeway sections, shipped when no size is mentioned. All cases single tier unless otherwise ordered.

Honey-packages in Tin.

Standard packages for storing and shipping extracted honey. Less chance for leakage or taint from wood; being square they economize space. Five-gallon cans boxed two or one in a box; gallon cans 10, 1/2-gallon cans 12 to box. Five, one, or 1/2 gallon can not boxed if desired. Prices on application for any quantity.

Place your order now; prices and prompt shipment guaranteed.

Honey and Wax for Sale

FOR SALE.—To reduce stock I offer for sale as follows: 26 cases of stock No. 40, and 40 cases of stock No. 44 at \$10.80 per case of two 60-lb. (new) cans. This is a raspberry-basswood blend, and is the cream of two apiaries; being extracted from select all-sealed upper stories. A third of a century's experience in the production of fine extracted honey. Ask for my little circular "A Word about Extracted Honey;" this will explain why it pays to buy this delicious stock.

E. D. TOWNSEND, Remus, Mich.

FOR SALE.—My new crop of white-clover extracted honey. Honey has been left in full charge of the bees for three weeks after harvest, and is rich, waxy, and of fine flavor, and is as good as a specialist can produce. Price is 8c. per lb. by the case of 120 lbs. or for the entire crop. Cash to accompany order.

LEONARD S. GRIGGS, 711 Avon St., Flint, Mich.

RASPBERRY HONEY, left on the hives until thoroughly ripened; thick, rich, delicious; put up in new 60-lb. tin cans; \$6.25 for one can; two or more cans at \$6.00 per can. Sample ten cents, and the ten cents may apply on the first order.

W. Z. HUTCHINSON, Flint, Mich.

FOR SALE.—Buckwheat, amber, No. 2 white comb, \$2.50 per case of 24 sections; unfinished and candied comb, \$2.00 per case; amber extracted ($\frac{3}{4}$ clover), two sixty-pound cans to case, at 8 cts.

QUIRIN-THE-QUEEN-BREEDER, Bellevue, O.

FOR SALE.—Choice extracted honey for table use, gathered from clover and basswood—thick, well ripened, delicious flavor. Price 9 cts. per lb. in 60-lb. cans, two to case. Sample, 10 cts.

J. P. MOORE, Queen-breeder, Morgan, Ky.

FOR SALE.—I have some extracted honey, well-ripened, fine, clover and basswood, in new five-gallon round cans, at \$5.50 a can; sample free; delivered f. o. b. cars here; ought to suit anybody.

MATHILDE CANDLER, Cassville, Wis.

FOR SALE.—Clover, amber, and buckwheat extracted honey. Table quality. Write for prices, stating your needs.

C. J. BALDRIDGE, Homestead Farm, Kendaia, N. Y.

FOR SALE.—Choice white-clover extracted honey, in new 60-lb. cans, or any shape desired. Ripened on the hives and guaranteed strictly pure. Sample free J. F. MOORE, Tiffin, O.

FOR SALE.—Fine extracted white-clover honey; also light amber fall honey, put up in barrels, 60-lb. and 10-lb. cans. Write for prices.

DADANT & SONS, Hamilton, Illinois.

FOR SALE.—Buckwheat extracted honey, 160-lb. kegs at 6½ cts.; 60-lb. tins at 7. J. I. PARENT, Ballston Spa, N. Y. Rt. 2.

Honey and Wax Wanted

WANTED.—Comb, extracted honey, and beeswax. State price, kind, and quantity.

R. A. BURNETT, 199 South Water Street, Chicago, Ill.

WANTED.—25 tons of fancy comb honey. Write, stating particulars, to C. M. CHURCH, New Kensington, Pa.

WANTED.—Choice extracted basswood honey. Prompt payment on receipt. Will pay 7c in new cans f. o. b. West Bend.

H. C. AHLERS, West Bend, Wis.

WANTED.—Choice white-clover honey in 60-lb. cans, also choice white-clover comb honey in Danz. sections, No. 1 and No. 2. State price f. o. b. here.

JOSEPH W. LEIB, 563 S. Ohio Ave., Columbus, O.

Bees and Queens

FOR SALE.—Moore's strain and golden Italian queens, untested, \$1.00; six, \$4.00; twelve, \$7.00. Carniolan, Banat, and Caucasian queens, select, \$1.00; six, \$5.00. Tested, any kind, \$1.25; six, \$6.00. Choice breeding queens, \$3.00 each. Circular free.

W. H. RAILS, Orange, Cal.

FOR SALE.—Italian bees and queens now ready. Untested, \$1.00; tested, \$1.50. Bee-keepers' supplies, Root's goods. Send for prices. Eggs from Silver-laced Wyandotte poultry.

N. V. LONG, Biscoe, N. C.

Wants and Exchanges

WANTED.—Bees for second-hand hives, thoroughly cleaned by steam; size 16x16; 10½ inches deep, ten-frame; suitable for the production of comb or extracted honey. Many of these hives are almost new. Would consider sending a carload to some responsible Texas apiarist in good locality for increase to fill on shares.

THOS. J. STANLEY, Manzanola, Otero Co. Colorado.

SWAP.—Round clear glass jars with screw-tin caps, and waxed; linear of 22-oz. capacity (nearly 1½ lbs.), in reshipping-cases of 2 doz. each; 6 cases at \$5.50, in exchange for choice white-clover extracted and comb honey; 12 cases or more at \$5.25 for each 6 cases.

JOSEPH W. LEIB, 563 S. Ohio Ave., Columbus, O.

WANTED.—To exchange for bees, one ladies' bicycle, one 4x5 photo outfit, and one breech-loading shotgun, all like new.

M. W. SHEPHERD, Wakeman, Ohio.

WANTED.—Refuse from the wax-extractor, or slumgum. State quantity and price.

OREL L. HERSHISER,
301 Huntington Ave., Buffalo, N. Y.

WANTED.—Bees on shares or lease for season of 1909; Pacific States preferred.

C. A. WURTH, 640 Leverette St.,
Fayetteville, Arkansas.

For Sale

FOR SALE.—A full line of bee-keepers' supplies; also Italian bees and honey a specialty. Melilotus (sweet clover) seed for sale at 8 cts. per lb. Write for catalog and particulars.

W. P. SMITH, Penn, Miss.

200 Bee Hives at a sacrifice; practically as good as new; set up and well painted, ready for the bees. Shipped to take K. D. rate. Regular Dovetailed and Langstroth, \$1.00 each. Langstroth-Simplicity and plain joint hives, 75 cts. each; four-frame automatic extractor, \$17.00. 60-lb. can honey, \$5.95.

L. M. GULDEN, Osakis, Minn.

FOR SALE.—Barnes combined machine, with two 6-in. and two 8-in. saws; one set Huther cutter-heads; used two months; good as new. I have my lumber worked up; will sell for \$35, cost \$45.

J. B. HOLLOPETER, Pentz, Pa.

FOR SALE.—Beautiful long-haired Persian and Angora cats and kittens; solid whites and various colors; none better. Send stamp for written reply.

KENSINGTON CATTERY, Marion, Ohio.

FOR SALE OR TRADE.—One Humphrey green bone-cutter, good as new—cost \$12. Would like to trade for a good Oliver typewriter and pay difference.

A. M. RINGER, New Lexington, Ohio.

FOR SALE.—Klondike strawberry-plants, \$3.00 per M., f. o. b. Beautiful magnolia-trees, 3 for 50 cts. postpaid.

R. H. MANLY, Rfverton, La.

FOR SALE.—Sweet-clover seed, 15 cts. per pound, postage extra. Root's supplies. ANTON G. ANDERSON, Holden, Mo.

FOR SALE.—Young English ring-neck pheasants. Cheap. Am overcrowded. Also old stock.

After you see this, address *me, individually*, at Bradentown, Fla., instead of Medina, O.

AN AERMOTOR OR GASOLINE-ENGINE FOR PUMPING WATER—WHICH?

I have spent some time in looking over the agricultural papers with the view of deciding whether I should pump with a windmill or a cheap engine for our one acre of land in Bradentown, Fla. The windmill is certainly the cheaper of the two, and it does not require any outlay for gasoline. But there are two objections: First, with the windmill you must have a reservoir to hold water to be used when the wind does not blow. This may cost as much as the windmill, or even more. Second, even in Florida we sometimes have several days with but little wind when we might need it badly and could not get it. This little engine will, however, give you an even steady stream just as long as you want it, and no longer, so there is no particular need of having a reservoir; and with such a rig it makes no difference whether the wind blows or not. In fact, it is very desirable many times to water your stuff just about sundown, and perhaps after dark; and that is the time when the wind is especially liable to "die down." Well, while I was considering all of these questions I happened to notice a pretty little advertisement on p. 1296 of our last issue. Just as soon as my eye caught a glimpse of the picture I wanted to swing my hat, and the price of the little engine is only \$37.50. I wish to congratulate the Aermotor folks on having hit upon such a neat device to "back up" the wind.

SWEET-CLOVER SEED.

We have on hand a good stock of choice sweet-clover seed, both white and yellow. Of the white we have both unhulled and hulled seed, and of the yellow we have at present about 250 pounds hulled, and have engaged a lot of unhulled yellow, which is expected to arrive soon. It is usually difficult to supply the entire demand for unhulled, white and yellow, and we suggest immediate orders, to be sure of getting some of our present stock. Prices are as follows:

In lots of	1 lb.	10 lbs.	25 lbs.	100 lbs.
Unhulled white, per lb.,	\$.15	.13	.12	.11
Hulled white, per lb.,	.22	.20	.19	.18
Unhulled yellow, per lb.,	.18	.16	.15	.14
Hulled yellow, per lb.,	.25	.23	.22	.21

If sent by mail, add 8 cents per lb. for postage. Leaflet on sweet clover sent with each lot of seed if requested.

THE YOUTH'S COMPANION

For 1909

The Best Christmas Present for \$ 1.75

There never was a household to which a Christmas Present of a year's subscription for The Youth's Companion did not bring unfeigned pleasure. If it is given to one of the younger members of the family, the older ones will have a large share in it. What other present costing so little is so certain to be appreciated and welcomed?

The fifty-two issues for 1909 will contain as much reading as twenty 400-page books of fiction, history, etc., ordinarily costing \$1.50 each.

Send for Sample Copies of the Paper and Illustrated Announcement of the New Volume.

CHRISTMAS PRESENT COUPON.

EVERY NEW SUBSCRIBER who at once cuts out and sends this slip (or the name of this publication) with \$1.75 will receive JM70

- GIFT 1.** All the remaining issues for 1908, including the Thanksgiving and Christmas Holiday Numbers.
- GIFT 2.** The 1909 Calendar, "In Grandmother's Garden," lithographed in thirteen colors, size 8 x 24 inches.

Then The Companion for the 52 weeks of 1909—a library of the best reading for all the family.

THE YOUTH'S COMPANION, BOSTON, MASSACHUSETTS.

Ten Cents

A Genuine 1900 Washer on Genuine Free Trial

You can have a *genuine* 1900 Gravity Washer to use a **full month** before you even make up your mind whether to keep it.

You need not send us a penny in advance. You need not make any deposit with anyone. You need not sign any notes, give any security or obligate yourself to pay us a penny unless you decide to keep the washer. And you need not decide whether to keep the washer until after the **FREE Trial**.

Merely say you will give our washer a fair trial and we will send you a genuine 1900 Gravity Washer **all freight prepaid**. Take this washer and use it a month. Do four weeks' washings with it. Then, if you're not satisfied, don't keep the washer.

Tell us you don't want our washer and that will settle the matter. We promise not to argue nor protest. Your judgment is all we ask, and if after the **FREE Trial**, you decide to keep the washer, then—we will trust you for it. Send us each month (or each month—suit yourself) *part of what the washer saves for you*.

In just a short while, your washer will pay for itself this way. Then—the washer is yours and all it saves is yours.

The *genuine* 1900 Washers are the most wonderful washers made. They are the longest and most durable. They are the easiest to handle. They wash your clothes cleaner than you can wash them any other way.

Our 1900 Gravity Washer is the *only* washer with two motions—swinging back and forth and moving *up* and *down* at the same time.

Then—as the 1900 Gravity Washer washes, your clothes are very gently squeezed between the top and bottom of the tub, giving the same good results as rubbing on a board, but without any of the wearing effect.

No other washers have these *double motion* and squeezing features. They are *exclusive* with the 1900 Gravity Washer and cannot be duplicated, nor imitated, because we have *all* the working parts of the 1900 Gravity Washer patented.

This is as much for your protection as ours.

Remember, *also*, that you can try one of these washers *without a penny of cost*. We trust any responsible party.

Send us a post-card, giving your name and address, and we will send you *post-paid* our new Washer Book telling how the 1900 Washers save time, and labor, and clothes, and make washing almost a pleasure. Address—

The 1900 Washer Co., 1275 Henry Street, Binghamton, N. Y.

If you live in Canada, address The Canadian 1900 Washer Co., 355 Yonge St., Toronto, Ont.

GREATEST HEALTH MAGAZINE IN THE WORLD

Teaches the Sick How
to GET Well

Teaches the Well How
to STAY Well

Here is Just What You have been Looking for.

A wide-awake, up-to-date, all-around health magazine, full of meat as a ripe nut, edited by America's leading authority on right living—a thoroughly dependable guide to perfect health.

GOOD HEALTH

Edited by J. H. KELLOGG, M. D.

Dr. J. H. Kellogg, the editor of GOOD HEALTH, is superintendent of the great Battle Creek Sanitarium, where thirty years of research and progress have developed a world-famous system of health training and healing the sick. Thousands swarm to Battle Creek yearly to learn at this great health university how to eat, to exercise, to bathe, and even to sleep for increased bodily efficiency.

GOOD HEALTH is the printed word representing this great system of correct living. It is not a dull, prosy book of exercises and diet rules, but a live, inspiring, illustrated magazine—one of the best-printed and most closely read publications in the world.

WHAT THEY ARE SAYING ABOUT IT

A BOON TO MANKIND

"Your health journal, Good Health, is a great boon to mankind. Every copy seems better than the former one. May success crown your efforts.

"L. J. BELKNAP, M. D."

FROM A TEMPERANCE WORKER

"The magazine grows better and better, and I try to show it wherever I go. The Mothers' Number I used at a mothers' meeting with much favorable comment.

MARGARET J. BILZ."

AN ADVERTISER SAYS

"We have received your October issue. A magazine like this ought to have a circulation equal to that of The Ladies' Home Journal.

"INDOOR WINDOW TENT CO."

GOOD HEALTH is the **original** health magazine. It is entering upon its forty-fourth year. Subscription price, single, \$1.00 per year. Canadian postage, extra, 35 cents. Foreign postage, extra, 50 cents. Send for our great clubbing offers!

Order to-day. Tear out this ad, write your name and address across it, and send it to us with one dollar for a year's subscription.

WHEN WE SAY

We're Big Dealers in extracted and comb honey we mean it. We've sought honestly from ocean to ocean, for a dealer who does a bigger business, but we can't find him.

WHEN WE BUY

We mail shipper check the day the shipment arrives. That's one reason why we get the choicest goods, the pick of the supply. We're mighty particular about promptly paying for goods we buy—ask any shipper who has ever dealt with us.

WHEN WE SELL

You get the best honey at bought-for-cash prices, backed by our reputation for square dealing. We've got finest Water-white Mountain-sage Honey; best White-clover Honey, and Water-white Sweet-clover Honey, all extracted, and all in crates of two 60-lb. cans to the crate. Ask for prices.

Beeswax bought and sold, too.

We build our business on the foundation of square dealing—and we are building it right!

Practical Works on Bees

THE books mentioned below, as well as those on the next two pages, are all devoted to practical bee culture, although a few of them, as will be noted by their descriptions, have more or less scientific value. A somewhat careful reading of the descriptions below will undoubtedly show any one just what book will suit him best. If several books are to be selected covering a wide range of subjects, the following list may be helpful in deciding what you want: A B C of Bee Culture, Langstroth on the Honey-Bee, Advanced Bee Culture. Or this list: How to Keep Bees, Forty Years Among the Bees, A Modern Bee-Farm.

Cook's Manual of the Apiary

is a very complete treatise on bees and bee-keeping, nothing of any consequence being omitted by its author, Prof. A. J. Cook, formerly of the University of Michigan. Even the anatomy and physiology of the bee has been very completely covered in this work, also bee botany, and yet the practical management of the apiary has not been slighted in the least. The edition was completely revised and partly rewritten in 1902, hence it is up with the times in every respect. Price \$1.15, postpaid; 15 cts. less by freight or express.

British Bee-keepers' Guide Book.

By T. W. Cowan. This is the leading English work on practical bee-keeping in England, and as such has had an immense sale, and has been republished in French, German, Danish, Swedish, Russian, Spanish, and Dutch. The work is condensed into 179 pages, handsomely bound and well illustrated. Price \$1.00 by mail; by freight or express, 5 cts. less.

Doolittle's Queen-rearing.

This is practically the only comprehensive book on queen-rearing now in print. It is looked upon by many as the foundation of modern methods of raising queens wholesale. Mr. Doolittle has an entertaining way of writing on bee subjects which enables his readers to follow him with pleasure, even if they never intend to raise queens at all. Bound in leatherette, 124 pages, 75 cts. postpaid; by freight or express, 5 cts. less.

Wax Craft.

By T. W. Cowan. We are now in position to take orders for the above book. It is elegantly bound and beautifully printed. See review by W. K. Morrison in our Sept. 1st issue. Price \$1.00 postpaid anywhere.

The Irish Bee-Guide,

by Digges, is, as its name implies, a guide to the bee-keeping industry of Ireland. This is a closely printed, well-bound book of 220 pages with excellent illustrations on fine paper. It would be useful to any one who wishes to become acquainted with the status of bee-keeping in the old land. Price \$1.00 postpaid; by freight or express, 5 cts. less.

A Modern Bee-Farm,

by Simmins, is one of those books which will cause you to sit up and take notice if you are a real live bee-keeper with lots of formic acid in your blood. The author is an English bee-keeper of note, who not only knows and understands bee culture in his own home land, but is as well an earnest student of American apicultural methods. He was the first man in the field with a non-swarming system of bee-management, and is otherwise a very original thinker on all that pertains to bees. He is not very orthodox in his views, but his book is all the better for that, seeing that he wants to take us out of the ruts. You can read the book right straight through, in the long winter evenings, as it runs along like a narrative or a novel. Cloth bound, 430 pages, 1904; price \$2.00 postpaid; by freight or express, 15 cts. less.

Amerikanische Bienenzucht,

by Hans Buschauer, is a bee-keeper's hand-book of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price \$1.00; by freight or express, 5 cts. less.

The Honey-Bee.

By T. W. Cowan. This is the standard work on the anatomy and physiology of the bee in the English language. It is packed with information on the subjects indicated, and expresses in a condensed, accurate manner every thing that has been discovered by the scientists of all countries who have studied the life history of the honey-bee. The book is beautifully bound, and printed and illustrated in the highest style of the art of book-making, and is invaluable to a bee-keeper. Last edition, 1904, 220 pages. Price \$1.00 postpaid. By freight or express, 5 cts. less.

Quinby's New Bee-keeping.

This, a modern edition of Quinby's Mysteries of Bee-keeping, is one of the most useful books on apiculture ever written. Mr. Quinby was an intensely practical bee-keeper and greatly assisted Mr. Langstroth in laying the foundations of American apiculture. His son-in-law, Mr. L. C. Root, revised the old book, giving it a new title and bringing it in line with the times. It is a simple, easily understood guide to bee-keeping. Cloth bound, 271 pages, 1905; price \$1.00 postpaid; by freight or express, 10 cts. less.

The A. I. Root Company, Medina, Ohio

PRACTICAL BOOKS

How to Keep Bees.

By Anna Botsford Comstock. The novice in bee-keeping usually seeks for a simple book on bees, and in this he is wise. The modern text-books relating to bees are excellent in their way, but most of them are too technical for a mere beginner, however well they may be written. A simple book written in clear every-day language is much better, even if it does not treat of quite so many little details which interest only the professional bee-keeper. In this respect "How to Keep Bees" fills the bill. The gifted authoress, who is a charming writer as well as an artistic engraver and bee-keeper, made a start with bees three different times, hence she had the opportunity of finding out for herself the difficulties and trials that beset the beginner with bees. She had no desire to make money with bees, but did so, however, because they prospered under her care and skill. For this reason she writes as an amateur to amateurs, making no attempt to discuss the knotty problems which the expert bee-keeper is interested in. The book is written in a charming literary style, easily understood, almost entirely free from the technical language used by bee-keepers. It is arranged in chapters, and so eminently readable withal, that any one interested in the subject can sit down and devour it clear through, the same as he would a modern novel. Everything the average beginner desires to know is discussed, including what to order if you have no bee-supplies or bees. The print is large, and some very beautiful engravings adorn its pages, for the authoress is one of the most skillful wood-engravers in America. We can not do better than recommend this work to every beginner in bee culture.

There are twenty chapters in the book as follows: 1. Why Keep Bees. 2. How to Begin Bee-keeping. 3. The Location and Arrangement of the Apiary. 4. The Inhabitants of the Hive. 5. The Industries of the Hive. 6. The Swarming of Bees. 7. How to Keep from Keeping too many Bees. 8. The Hive and How to Handle it. 9. Details Concerning Honey. 10. Extracted Honey. 11. Points about Beeswax. 12. Feeding Bees. 13. How to Winter Bees. 14. Rearing and Introducing Queens. 15. Robbing in the Apiary. 16. The Enemies and Diseases of Bees. 17. The Anatomy of the Honey-Bee. 18. The Interrelation of Bees and Plants. 19. Bee-keepers and Bee-keeping. 20. Bee-hunting.

There is also a bibliography and index. From a beginner's standpoint it is a complete treatise on bees.

Cloth bound (228 pages), price \$1.10 postpaid.

Doubleday, Page & Co., New York City.

THE SWARTHMORE LIBRARY.

A series of booklets on bee subjects by E. L. Pratt, of Pennsylvania, known to the bee-keeping world as "Swarthmore." These books are full of the most valuable information. The Swarthmore method of queen-rearing is spoken of as the most important innovation in bee-keeping in recent years.

Increase.

The first of the series. Any one desiring to enlarge his apiary should learn the Swarthmore way. Price, postpaid, 25 cts. French edition, entitled "Accroissement," 50 cts. postpaid.

Baby Nuclei.

The using of little frames and a handful of bees for mating queens has created quite a stir in the queen-rearing business. From this booklet you get your information direct. Price, postpaid, 25 cts. French edition, entitled "Nuclei Miniatures," 50 cts. postpaid.

Commercial Queen-rearing.

A complete description of the Swarthmore methods of queen-rearing in regard to cell-getting. Price, postpaid, 25 cts.

Forcing the Breeding-Queen to Lay in Cell Cups.

This little book rounds off the Swarthmore system. It is the finishing touch, and ought to be read by all queen-breeders. Price 25 cts.

Simplified Queen-rearing.

Revised edition. It tells the honey-producer how to rear queens by the very simplest method ever published. Good queens for little money and little trouble, in just an effective and economical plan for the bee-keeper who works for profit. Price 25 cts., postpaid.

E. L. Pratt, Swarthmore, Pennsylvania.

A Book for Bread and Butter Bee-keepers, by a Practical Bee-Keeper who Knows.

By W. Z. HUTCHINSON

This is, as its name implies, a book for the professional or more advanced bee-keeper, one who has mastered the elementary details of the business, and who is looking for ideas which he can use in his work. It is particularly good for the bee-keeper who wishes to know how large bee-keepers lay out their work; how they manage out-apiaries; how they extract and how they prepare for the market, and all the various details of the business of keeping bees. It is almost equally good for beginners also. The author of

Advanced Bee Culture

is Mr. W. Z. Hutchinson, editor of the *Bee-keepers' Review*, who has had a long and varied experience in practical bee-keeping. He writes in a very clear and accurate style, so that there is never any difficulty in following his meaning. He eschews the scientific part of bee-keeping, being content to study the commercial side only. The book itself is beautifully printed and illustrated, and very prettily bound. It is a book the advanced bee-keeper will often turn to just to see how other skilled men do their work. One good hint will pay for the book many times over, and the author having been through the mill himself always sees the salient features of a system. In his quest for information Mr. Hutchinson visited many able bee-keepers with eyes and ears wide open, that he might be the better able to assist his readers with ideas they could use in their every-day work in the apiary.

He is an excellent photographer, therefore it is not to be wondered at that he supplies a number of very beautiful illustrations which not only adorn but instruct. Perhaps we can do nothing better than give a list of chapters, as follows: Bee-keeping as a Business; Making a Start in Bee-keeping; Mistakes in Bee-keeping; The Influence of Locality; Best Stock and How to Secure It; The Choice of a Hive; Honey-boards and Queen-excluders; Sections and Their Adjustment on the Hive; Arrangement of Hives and Buildings; Comforts and Conveniences in the Apiary; Shade for Bees; Contraction of the Brood-nest; The Use and Abuse of Comb Foundation; Increase, Its Management and Control; The Hiving of Bees; Commercial Queen-rearing; Introducing Queens; The Feeding of Bees; The Production of Comb Honey; Producing Good Extracted Honey; Migratory Bee-keeping; Out-apiaries; House-apiaries; Foul Brood; Apiarian Exhibits at Fairs; The Fertilization of Queens in Confinement; The Rendering of Beeswax; The Relation of Food to the Wintering of Bees; Outdoor Wintering of Bees; The Ventilation of Bees; The Relation of Moisture to the Wintering of Bees; The Influence of Temperature in Wintering Bees; Care of Bees in Winter; Index.

\$1.20 postpaid; or the book and the Review for 1908 and 1909 for only \$2.00.

Flint, Mich.

Up to Date in Every Respect.

Good for Veteran and Beginner Alike.

Full of Practical Ideas.

PRACTICAL BOOKS

Forty Years Among the Bees

... by ...
Dr. C. C. Miller

This is the plain unvarnished story of Dr. Miller's bee-keeping experiences for a term of forty years and more. He was probably the first man in America to depend solely on bees for a living, and for this reason alone the book is well worth reading. He has taken a prominent part in building up the bee industry of America in all those fateful years from the time bee culture was an infant industry until now. This has given him a fund of rich experience to draw on, and he freely uses it for the benefit of his readers. He has adopted throughout his book a simple conversational style which makes him readily understood, and renders the book easy reading to any bee-keeper. Even the beginner enjoys it. To the comb-honey producer it is of engrossing interest, for Dr. Miller is what we term a comb-honey man. In a delightful way he tells what he has done in the past, what he is doing now, and what he intends to do in the future, giving the reasons for his change of mind. The extracted-honey men also like to read this simple narrative because the principles of comb-honey production are much the same as in producing extracted honey. He does not hide away the smallest detail, and one soon becomes acquainted with his family circle, his home and its surroundings, his helpers, his out-apiaries, and all that goes to make up home life and life's work. This impresses the reader in a way that the ordinary bee-keepers' manuals can not do. However, the work is not intended as an instruction-book in bee-keeping, but it affords an excellent supplement to any of our well-known manuals of bee culture. No comb-honey man should be without it, because its author is one of the most successful comb-honey men this country has produced. He has no "secrets," but tells all he knows in a way that is convincing. What adds to the interest is the fact that he lives in a locality not particularly well adapted to bees, because the winters are long and the honey flora somewhat uncertain. The print is large and clear, so that it may be read by lamplight when the bees are in the cellar and the snow lies deep. Order a copy—only a dollar, postpaid. Or with American Bee Journal one year—both for \$1.50. Address all orders to

American Bee Journal, 118 W. Jackson, Chicago

Twentieth-century Edition

Langstroth on the Honey-bee

Revised by C. P. Dadant

THIS book was originally written by the Rev. L. L. Langstroth, the founder of modern bee culture. Its first publication, in 1853, caused a revolution in bee culture, not only in America but all over the civilized world. It is the modern bee-keeper's epic. Father Langstroth repeatedly revised the book as the various editions appeared; but when he got too old he turned over his duty to a great friend of his, Mr. Dadant. The French edition of "Langstroth on the Honey-bee" is the standard work on bees in France.

The work itself is quite comprehensive, and it covers the whole field of bee-keeping in its 575 pages. It has a very large number of excellent illustrations, some of them by Count Barbo, on the anatomy of the bee, being very fine examples of the engraver's art. In the first chapters the anatomy and physiology are dealt with; then the food of bees, etc. Comb and propolis are fully treated. Then follow chapters on movable-frame hives, wherein the evolution of our modern hives is traced. The ventilation of hives and cellars is excellently treated, and also observation hives. A chapter is devoted to the taming of the honey-bee. Swarming, both natural and artificial, is carefully considered, and primary and secondary receive a full notice. A long chapter is devoted to queen-rearing and nuclei. Doolittle's system of queen-rearing is fully explained, as also queen-introduction. Out-apiaries, robbing, and wintering are most thoroughly explained. As Mr. Dadant is a great expert on beeswax it is needless to say the chapter on that subject is fine. There are splendid chapters on the honey flora. Honey production, and foul brood. There is also a bee-keeper's calendar and a selection of axioms for bee-keepers generally. It is a great book, and the price is low for a handsome well-bound volume as this is. . . PRICE, postpaid, \$1.50

POPULAR BOOKS

The Honey-Makers.

By Miss Margaret W. Morley. This is the story of the life of the bee, told in very interesting style—how it lives, gathers honey, and all about it. While clothing the general subject with an air of poetry, it seems to be entirely within the limits of known facts while attempting to deal with them. We believe it will give all thoughtful bee-keepers a greater liking for their business to read it. Probably it has more to do with the curious traditions connected with bees than any other book of the kind. Price \$1.50 postpaid; by freight or express, 10 cents less.

The Life of the Bee.

By Maeterlinck. This is a masterpiece of fine writing by a modern Shakespeare. The words fly from the pen of this writer like sparks from a blacksmith's anvil, the result being a glorification of the honey-bee. Maeterlinck is considered by many to be the finest writer now living, and any thing from him is sure to be worth reading. He is, to a certain extent, familiar with bee-keeping, but the truth about bees does not interest him so much as the romance of the queen and the drone and the swarming instinct. The book itself is well bound and beautifully printed. Cloth bound, 42 pages. Ed. 1903, price \$1.40 postpaid; by freight or express, 10 cts. less.

The Bee People.

A book on bees, especially for children, from the pen of Margaret W. Morley. Including its elegant illustrations, it is, in some respects, the prettiest bee-book in existence. It has 177 pages, very coarse print, the reading being ingeniously interwoven with the illustrations showing the parts of the bee. The story of bee-life is told in a fascinating manner, and is well calculated to get the casual reader, as well as children, interested in this useful insect. The cuts go just enough into detail to explain fully the lesson taught, without confusing the mind with other things. We think the book well worthy a place in every bee-keeper's home. Fittingly designed cover. Price \$1.50 postpaid; by freight or express, deduct 10 cents.

The Swarm.

By Maurice Maeterlinck, author of *The Life of the Bee*. This is a book of 113 pages, prettily bound in cloth. Price \$1.20 postpaid; by freight or express, 10 cents less.

The Bee-Master of Warrilow.

Tickner Edwardes. Cloth bound, 64 pages; 57 cents postpaid; by freight or express, 7 cents less.

The Lore of the Honey-Bee.

By Tickner Edwardes, author of *"The Bee-Master of Warrilow,"* *"An Idler in the Wilds,"* etc. Setting aside the many popular technical treatises on bee-keeping, there is at present no work by a modern English writer dealing with this fascinating subject, from the literary and antiquarian, as well as the scientific point of view. Succinctly, *The Lore of the Honey-Bee* is a history of bees and their masters from the very earliest times down to the present. The wonderful communal life within the hive is touched on in all its varying aspects; and the reader is introduced to a class of men from all ages as quaintly original as their calling is inimitably picturesque. The book covers the whole field of ascertained facts in the natural history of the honey-bee, as well as the romance of bee-manship past and present; and nothing better could be put in the hands of the beginner in apiculture, no less than in those of the advanced student of what is probably the oldest human occupation under the sun. Price \$2.00 postpaid.

Bee-keepers' Ten-cent Library.

The following books are neatly bound in attractive papers, well illustrated. Just the thing for the beginners to help them with their troubles. Price ten cents each postpaid.

- No. 1. BEE-KEEPERS' DICTIONARY.
- No. 2. INMATES OF THE HIVE.
- No. 3. HONEY-COMB.
- No. 4. HANDLING BEES.
- No. 5. TRANSFERRING BEES.
- No. 6. BUILDING UP COLONIES.
- No. 7. THE HONEY-FLOW.
- No. 8. SWARMING.
- No. 11. WINTERING BEES.
- No. 12. SPRING MANAGEMENT OF BEES.
- No. 13. BEE DISEASES.
- No. 15. ESTABLISHING AN APIARY.
- No. 16. MODERN QUEEN-REARING. We have also a French edition entitled "Elevage Moderne de Reines," and a Scandinavian edition entitled "Moderne Dronningavl," 25 cts. each.
- No. 17. HABITS OF THE HONEY-BEE.
- No. 18. BEE-KEEPING FOR CLERGYMEN.
- No. 19. BEE-KEEPING FOR WOMEN.
- No. 21. FACTS ABOUT BEES.
- No. 23. BEE-KEEPING IN JAMAICA.
- No. 24. BEE-KEEPING IN THE WEST INDIES.
- No. 25. HOW TO PRODUCE EXTRACTED HONEY.
- No. 26. THE DZIERZON THEORY.
- No. 27. DOVETAILED HIVE AND ITS USES.
- No. 28. DIVISIBLE-BROOD-CHAMBER HIVE.
- No. 29. MOVING AND SHIPPING BEES.

A Bee-Model.

Nearly every bee-keeper is desirous of knowing the main facts of bee anatomy and physiology, but usually is deterred from investigating the subject by the formidable character of the work involved, and mentally decides to defer it to some more convenient season. There is no good reason for doing this if they possess one of our new bee-models where-with any amateur bee-keeper can obtain a comprehensive idea of the whole anatomy of the bee at a glance.

This is done by means of a skeleton bee of a large size made out of cardboard. Each individual part is numbered, and by consulting the key the name of it may instantly be found. The size of the artificial queen is 5x7 inches, and the drone $5\frac{1}{2} \times 4\frac{1}{4}$, so that each part is sufficiently large to enable the student to get a good clear view of it. This is the important feature, and it is one that is not usually understood by those who may never have seen one of these bee-models.

The bee-model is gotten up on the style of a little girl's paper doll. It looks outwardly like a large brown bee pasted to a piece of cardboard. On lifting the outer flap the whole anatomy of the bee is unfolded. The various parts may be all seen by lifting all the flaps in their order. The following parts of a queen are shown: Antennae, scape, compound eyes, ocelli, claws, tarsus, planta, tibia, femur, velum, scraper, thorax, abdomen, anterior wing, posterior wing, air-tubes, air-sacs, tracheae, base of compound eyes, gullet, honey-sac, chyle-stomach, ileum, large intestine, vent, stomach-mouth, malpighian tubes, rectal glands, poison-sac, ovaries, oviduct, mucus duct, semen-duct, spermatheca, gland, vagina, upper-gullet nerves, under-gullet nerves, optic nerves, ganglia of fore legs, general system of nerves. For the drone the list is the same except for the reproductive system, as follows: Testes, seminal duct, seminal vessels, mucus glands, ductus seminalis ejacularis, penis-sac, horns of the male organ, fan-shaped appendage, male organ.

By means of this model and a careful study for a few weeks the average bee-keeper could learn to name each part of the bee's anatomy correctly without the least hesitation.

With this aid to knowledge in his possession there is really no excuse for any bee-keeper remaining ignorant on these points. Besides being ingenious these bee-models are artistic and scientific, and well worth the price asked for a pair (queen and drone), namely, \$1.00 postpaid. Single copy of either queen or drone, 50 cents. A key accompanies each.

A GREAT OFFER

Two Leading Publications a Whole Year and a Beautiful Colored Picture all for Price of One

We have perfected arrangements whereby we can send that practical farm and family paper, FARM AND HOME, in connection with GLEANINGS IN BEE CULTURE, on the remarkable terms as given below.

Semi-
Monthly
National

FARM AND HOME

24 Nos.
Over 600
Pages

We are unable to give but a brief description of Farm and Home which is unequalled for variety and excellence. It is pure, bright, and practical all the way through, teeming with late and reliable information. For village, suburban, and rural residents it will be found well-nigh indispensable, meeting the requirements of the entire family. No better proof of its popularity can be offered than its enormous circulation, which extends into every State and territory, each number reaching OVER TWO MILLION READERS. Sample sent free on request.

FREE . . . THIS COLORED PICTURE . . . FREE

An extremely attractively picture, appealing forcibly to every lover of child life—and who does not enjoy watching such a scene of complete innocence and happiness as the artist has depicted in the painting? From an artistic standpoint as well, this picture makes a most favorable impression, with its dainty and beautiful colorings, its accuracy of detail and lifelike arrangement. . . . The above illustration, although greatly reduced in size, gives a fair idea of its appearance. This picture is made in the very popular panel shape, so desirable for narrow wall spaces, and measures 12x20 inches in size. It is mounted on heavy lithographic paper with narrow white margin around for framing if desired.

OUR OFFER

Gleanings in Bee Culture, 1 yr. \$1.00 } Both for **\$1.25**
Farm and Home, one year . . .50 } Only

AS A SPECIAL INDUCEMENT for prompt replies to all who accept the above offer we will also send the picture above described, without further charge.

YOU MAY LAUGH

When you read the article by Geo. W. Williams in the December *Review*; and yet I laughed when I first read about the bee-escape. I believe my brother Elmer even rolled in the grass, he was so amused. I believe that the ideas set forth by Mr. Williams appear about as ridiculous as any that have ever been published in the *Review*; but if they prove to be true, as indicated by his experience of the past season, the article will prove the most valuable of any the *Review* has ever published.

Send ten cents for this issue, and with it will be sent two other late but different issues, also a four-page paper containing some clubbing and premium offers that will surprise you. The ten cents may apply on the first subscription that you send in.

THE 1900 WASHER.

Nothing could better illustrate the very great change which has occurred in the methods of doing business than the advertisement of the "1900 washer," placed on another page of this journal. A few years ago no business man would have dared to make such an offer as this company now makes to the readers of GLEANINGS. They actually let a responsible prospective buyer have the use of the machine four weeks without the payment of a single cent in cash or its equivalent. This would not seem very extraordinary if the would-be buyer were well known to them; but to extend such an offer to entire strangers is certainly wonderful. Their faith is founded on a well-known fact that people everywhere will strive to pay for an article that has merit and is worth the price asked. The fact, also, that the seller has faith in the buyer's fairness also goes a long way with most of us. The whole transaction is founded in a remarkable faith in the common people of this country, and ought to receive the encouragement it truly deserves. If you are in want of a washing-machine, or likely to require one soon, we hope you will take advantage of this offer.

"IRON AGE" TOOLS.

The fame of the "Iron Age" garden tools is world-wide; but not every one knows they are all made by the Bateman Mfg. Co., Grenloch, N. J. For all kinds of light cultivation or garden work these tools are surpassed by none. Wherever civilization extends, these "Iron Age" tools are seen, and even in countries far remote, where civilization is supposed not to be, these tools are in actual every-day use. This shows how a good article with substantial merit will make its way over all obstacles, and triumph over all prejudices and national or racial exclusiveness. It is a great pleasure for an American to travel in remote regions of our globe and come on a man using tools with the talismanic words IRON AGE, made by the Bateman Mfg. Co., Grenloch, N. J. For us, therefore, to praise the wares of this concern would be a work of supererogation. The best thing to do under the circumstances is to write to the company for their catalog to see if they do not make something that is just what you require to lighten the labor of cultivating your garden patch.

We Have Time to Handle ONLY THE BEST

THAT is why we handle, recommend, and sell so many **MUTH SPECIAL DOVETAILED HIVES**. From the selection of the seasoned, straight-grained, high-grade lumber (which costs US more than we could buy "good-enough" stock for, if we cared to use it) to the finished, non-warping, thoroughly satisfactory hives, OURS are THE BEST. Do you think we could sell TEN CARLOADS of inferior hives in a year? Not much! But we can—and DID—sell ten carloads of MUTH SPECIAL hives in one year, because they MADE GOOD.

This is the standard we maintain in ALL our bee-supplies. Whatever you get here, whether it is a bee-veil or a hundred hives, you can rest well o' nights, knowing that the goods are **UP TO THE MUTH STANDARD**, than which there is no higher.

Goods have to be extra special to be handled by us, or to get into our catalog. WE ARE BUILDING OUR SUCCESS ON THE SATISFACTION OF OUR CUSTOMERS. Going to send for our catalog to-day, aren't you?

OLD HAMPSHIRE BOND PAPER.

It is always very good policy to use good paper, either in social or business correspondence, for many good reasons. We know fine paper is apt to create a favorable impression, even before we have read the letter on which it is written. In doing business with entire strangers by mail we are generally quite anxious to make a good impression; and one way of doing it is to order the printer to use Old Hampshire Bond in making up your stationery. He will perceive at once that you want a good job and will make his printing fit the paper. It is a mistake to suppose any sort of paper and any kind of printing will answer the demands of modern commerce. A good business man is expected nowadays to use good stationery, etc.; and unless he does so his trade will suffer, more particularly with strangers. If you are in doubt, just specify "Hampshire Bond," and you are safe. Every printer knows the name, and has some of this paper in stock for his best customers. Don't let him palm off a substitute on you. He can easily get more Hampshire Bond when he wants it. Send for samples of their paper as advertised on our last cover page. Their samples show various color combinations which can be used to advantage many times.

SOMETHING ABOUT GASOLINE-ENGINES.

I have mentioned before that I have been looking at the matter of a cheap little engine to run my bone-cutter, to pump water for my garden, and do similar work around my home in Florida. Huber and Ernest, several years ago, made a thorough investigation to find a small engine suitable to run our honey-extractors, and they finally decided on the Gilson engine as advertised elsewhere. They believed that it was the best engine for the money, on the market, and the experience of over two years has shown that they were not mistaken.

There is a big demand for small two-cycle engines to propel boats. I think they are now advertised for thirty or forty dollars, for any boat to save the laborious work of rowing, but the boys tell me that all of these small cheap engines are extravagant in the use of gasoline. For instance, one of these boat-motors will take as much gasoline in running an hour as

the larger and more finished engine, such as is advertised in this issue by the Gilson Mfg. Co., would require to run it a whole day. In view of this, I decided to use the one we employ to run our extractors, even if it is a little larger than I need at present—one that "goes like sixty, sells like sixty, sells for sixty." You see it is always an excellent idea (while you are making a purchase), to have a little more power than you actually need at the time. We have had such good reports from these engines that we feel perfectly safe in recommending them. The same concern builds other styles of engines up to 16-horse-power. All who are interested will do well to write the Gilson Mfg. Co., 624 Park St., Port Washington, Wisconsin.—A. I. R.

"GOOD HEALTH" MAGAZINE.

Those of our readers who earnestly desire to keep well informed on all the latest ideas with regard to personal hygiene and sanitation can hardly do better than purchase a year's subscription to *Good Health*, published at Battle Creek, Mich., which town is now very properly regarded as headquarters for all information pertaining to good health.

The knowledge which *Good Health* sets forth is written in a style suitable for popular reading. It is not a doctor's journal, though many doctors read it, but is rather meant for the great army of common people who try to keep themselves out of the doctor's hand. Read what Mr. A. I. Root says about *Good Health* in our November 15th issue.

BEE-KEEPERS' SUPPLIES.

We call the attention of our readers to the advertisements of the bee-supply dealers appearing in this issue. No matter in what part of the country you live, you will find an advertisement from a dealer near you. This is the best season of the year to buy bee-keepers' supplies, for you will have plenty of time to get them ready for use in the spring and will be able to save money too, for most dealers offer discounts for early orders. Consult these pages often during the next few weeks when making up your bee-supply orders.

A Distinction and a Difference

Your Opinion

There are arguments for and against class publications, but there are class publications and **CLASS PUBLICATIONS**. **Gleanings in Bee Culture** is in a class by itself—there is no other field like ours.

YOU can not class it in general terms or measure its tremendous power as an advertising medium by a surface view of conditions.

Our Knowledge

WE know that there is hardly a single article advertised in the general magazines that can not be profitably advertised in our columns. The bee-keeper of to-day will buy almost any thing that is properly advertised. A recent canvass of our subscribers shows that they are interested in the purchase of a wide class of merchandise, including farm implements, poultry and nursery supplies, home improvements, including bath-room fixtures and water systems; breakfast foods and food products, automobiles, pianos, etc.

An Agency's Confidence

Gleanings in Bee Culture has a peculiar influence over its readers, for many have been subscribers since its first issue thirty-six years ago, and to them it is first of all a home magazine and a family friend. This spirit of good will was recognized by the president of a prominent advertising agency when he said: "The secret of such remarkable returns secured by so many advertisers in **GLEANINGS** is due, in my judgment, to that peculiar hold which Mr. A. I. Root has on his readers—that *esprit de corps* which exists between him and your subscribers."

An Advertiser's Report

Every one of its 100,000 readers (we figure only three readers for every paper) scan each number from cover to cover. The advertising pages are read with as much interest as any other part of the paper. Our readers are a busy people; few of them buy all the leading magazines, but they always find time to read **GLEANINGS IN BEE CULTURE**; in fact, in many instances it is almost the only magazine of any note going into the home. Our readers have implicit faith in advertisements accepted by us, and patronize advertisers liberally. For instance, read the following extract from a letter from the National Fur and Tanning Co.: "You will be glad to know that, from the twenty papers in which our advertising appeared last year (winter of 1907-'08), there were only two which made a better showing. In one paper—a farm paper which has a national reputation—the inquiries cost us three times as much as they did in **GLEANINGS**."

What better proof can advertisers want that our columns will bring results than the actual facts stated above? We solicit no advertising which we know will not pay the advertiser well. Write us for particulars on any point.

"If goods are wanted quick, send to Pouder."
Established 1889

EXACTLY SO.

By the Bee Crank

System in a bee colony is one of the cardinal virtues. No merchant prince ever perfected an organization that compares with the methodical way in which the business of the bee is conducted. Bee-men well know, for example, that the hexagonal cells of the honey-comb are laid out with marvelous accuracy. So wonderful is their precision that Reaumur, a French scientist, at one time suggested that the side of these cells be adopted as the unit of measurement for the metric system, because it is more nearly unvarying than any other standard that nature affords.

The Pouder System. My system for handling orders is modeled along the lines laid down by the bees. I do not claim that it is an improvement upon that, but it is as near perfect as human ingenuity can make it. Years of close attention to the details of the bee-supply business has qualified me to offer the bee-men a class of service that for promptness, accuracy, and minute attention to details is almost perfect. Bee-men who have experienced exasperating carelessness of some dealers will appreciate Pouder Service; and to have Pouder

Service is worth a great deal to you, but costs you not one cent, for I sell Root's goods at Root's prices, and all other standard supplies at the very lowest figures. All cash orders received during December will be allowed a special discount of four per cent for the purpose of putting a little ginger into this quiet month. In January the discount will be three per cent.

When you want what you want, when you want it just as you want it, send to me. You should have a copy of my catalog on your file. A postal will bring it to you. Orders from the Root catalog receive the same attention as though made up from my own.

BEE SWAX. I can dispose of all the beeswax that you can spare, and am now paying 28 cents cash or 30 cents in trade, delivered at Indianapolis. Now is an excellent time to box up your wax and exchange it for supplies so that, when supplies are wanted, they will be ready.

Let me hear from you. Every communication sent here is entitled to an immediate and courteous reply.

Walter S. Pouder,
513-515 Massachusetts Avenue, Indianapolis, Ind.

DECEMBER 15, 1908

NO. 24

STRAY STRAWS

DR. C. C. MILLER

MARGARET GRAY is advised, page 1444, to remove honey from the hive to prevent granulation. Does honey granulate sooner in the hive than out? [No. Quite the other way, or at least that has been the general impression.—ED.]

LET ME ADD a little to that reply to Charles Reynders, p. 1443. If you receive a queen that you don't want to use immediately you can put her caged in any strong colony, putting the cage between the brood-frames, but not allowing the bees of the hive to get at the candy. I think she might stay a month all right.

HONEY "is not spoiled in cooking as many good foods are," p. 1430. Quite right as intended, but it does not mean that you can boil honey without spoiling it. A very little cooking beyond 160° hurts the flavor. [Boiling honey certainly does spoil it for table use; or, rather, we should say, it greatly mars its flavor.—ED.]

ABOUT THAT twenty colonies from nine, page 1443. It is quite possible, as stated, "that two of that nine were strong enough to make two other colonies each." It's perhaps a little more likely that from each of the nine colonies a single frame was taken, these nine frames being used to make the two colonies. [We accept your amendment.—ED.]

DRONE COMBS in supers. "Unless perforated zinc is used the queen would be quite sure to occupy this drone comb," page 1425. Let me add that, if perforated zinc is used, the bees will hold open more or less of the drone comb for the use of the queen. I judge this from the fact of seeing sections not entirely filled with worker foundation, and the vacancy filled out with drone comb, the drone comb entirely empty when the rest of the section was filled with honey. [Since Dr. Miller speaks of it, we remember there have been reports of how drone-cells would be left open and empty, while the worker would be filled with honey. Who else has any thing to offer on this subject?—ED.]

E. D. TOWNSEND has hit it exactly in that bottom paragraph, p. 1432. An eight-frame hive is too small for extracted honey, and possibly for comb. At any rate, no one should fool with an eight-frame hive unless he intends to give his bees the very closest attention. But I am not so sure about some things in the preceding paragraph. He says, "Bees on ten frames of brood will store the same amount of honey whether the brood is all in one hive, or divided into two parts and in

two hives." I haven't the figures at hand; but from some of the authorities across the water has come the statement, never before contradicted, to the effect that, if one colony is twice as strong as another, it will store *more* than twice as much honey.

THAT COMB HONEY 12 years old, p. 1437, reminds me. Years ago, on a visit to my mother I spoke of sending her some honey. She said, "Why, Charles, you don't need to send me any. I have plenty left from last year." "Oh! but last year's honey is no longer so good," I said. "Oh! but it is," she replied. "Please show it to me." To my surprise she showed me sections of honey that were faultless. "Where do you keep it?" I asked. "Up in the garret." If you know what a garret or attic is, you know it is a very cold place in winter, but roasting hot in summer. The roasting the honey got in the latter part of summer seemed to have thickened it so that the winter's freezing did not affect it. Afterward I saw at a Rockford convention section honey in perfect condition that had been kept over in the same way.

AFTER READING about clover, p. 1426, I went out to reconnoiter. We had one of the worst drouths last summer I ever knew—perhaps the worst. No rain fell from August 11 till Sept. 27—47 days. In the cow pasture, which has not been ted down for some time, I found abundance of young clover, and I see no reason why it may not be as good next year as this. In the horse pasture, which has been continuously and severely grazed, I saw no clover. However, putting on my specs and getting down on my hands and knees I could see here and there wee clover leaves started. I doubt if there'll be a very big show there next year, when this year it was a mass of white. [We should be glad to get reports from others who may know the exact conditions, as it must necessarily have a strong bearing on the price of clover honey at least.—ED.]

IS IT TRUE that "what kills the clover is not the drouth, but too much water in the ground and hard freezing"? If farmers agree on that I'll take their word for it; but naturally I should think just about the opposite. I think it is generally believed that it isn't so much freezing that hurts as thawing, especially frequent and rapid freezing and thawing. Wet ground is slower at thawing out than day, and the dryer the ground the more rapid the freezing and thawing, I should think, hence the more harm. [You may be right; but is it not possible that a wet soil heaves more—that is, expands more during the process of freezing—than a dry one? Now, the roots of clover extend for several inches into the ground,

and the expanding of a wet soil, through the process of freezing, would necessarily have a tendency to break some of the roots. A dry soil, with very little or no water in it, could expand no more than so much dry sawdust in a box; but wet that sawdust, and the process of freezing will burst the sides of the box and cause a slight elevation in the middle, just as we find is the case with a pail of water that has frozen over night.—Ed.]

"It PAYS to melt old combs," p. 1425. Figures are given to prove it. May be they prove it, and may be they don't; depends upon whether a frame of foundation is worth as much as one of old comb. Sometimes it is, oftener it isn't. Even with the best of old comb, melting may pay big in a foul-broody locality. [On your first point there are a good many who will differ with you. Old combs have a tendency, so some extracted-honey producers say, to discolor the honey. While the amount of discoloration is very slight, it is appreciable. Then, too, is it not true that a nicely wired frame of foundation is preferable to an old propolized frame containing old comb more or less mutilated and unwired?]

Then there are quite a school of bee-keepers who believe that worker-cells in old combs are contracted, to the detriment of brood-rearing. While we ourselves do not take much stock in this, yet it has weight with some.

We have placed frames of foundation in extracting-supers in the height of the honey-flow, and had them filled out in from 24 to 48 hours. These new bright combs, perfectly clean, with the assurance that they are absolutely free from disease—well, we will take them in preference every time, even if they do cost a little time and energy on the part of the bees to draw them out.—Ed.]

WHEW! Mr. Editor, you seem to be a radical of the radicals on the subject of deep bottom-boards, p. 1424. I supposed I was the original simon-pure blown-in-the-glass advocate of deep spaces under bottom-bars with my 2-inch space. If you're going to advocate 1 to 3 inches with nothing to prevent building down, I'll fight you for infringement. I suspect there's a mistake in that statement that "between the bottom-bars and floor of the bottom-board the space can be anywhere from 1 to 3 inches, and the bees will not build comb except during an exceptionally heavy honey-flow." The flow from dandelion is not an "exceptionally heavy honey-flow;" yet when I have failed to put in bottom-racks I've had lots and lots of comb built down in the two-inch space during dandelion flow. If I should leave more than about an inch of space below bottom-bars any time when bees were storing in supers, I should expect building down *every time*. To be sure, a little comb built down can be cut away, and no harm done; but the amount is not so very small, and the comb is likely to be built crosswise, so it must be cut away every time combs are lifted out, and the amount of brood lost is a serious matter. I am speaking from experience.

Any thing more than about an inch will make the final space really smaller. That seems a little contradictory, doesn't it? Let me put it in concrete form. Suppose hive A has a one-inch

space, and hive B a two-inch space. Hive A will preserve its one-inch space. Hive B will commence building down; but it will not stop building when it gets within an inch of the floor, but will keep on until there's only $\frac{3}{8}$ inch between combs and floor. So you see that B, with its original two-inch space, has only half as deep a space finally as A.

Moral.—Have a two-inch space under bottom-bars (deeper if you like), and then for the time when there's danger of building down, put an open-work bottom-rack, allowing only one inch under bottom-bars. [This question must be largely one of locality. We certainly have had reports where there was a space as deep as three inches under the frames, and no comb was built in it except during exceptionally heavy honey-flows. We may suggest that, where the flow is heavy, like that from basswood, the bees will fill up a three-inch space; but where it comes in very slowly, with cool nights, the space would not be occupied. We do not just now remember the exact circumstances, but we are of the opinion that there were conditions when the three-inch space was tolerated. There is a comfortable feeling in view of what you say that we have never had the space more than one inch under our factory hives, believing it would be wise to err on the safe side. We should be glad to get reports, especially from those who found they could use a three-inch space to advantage. In the mean time we suspect it would be safe for the average person to go no further than Dr. Miller, and use a rack or dummy by which the space under the frames can be contracted during the honey-flow to one inch or less.—Ed.]

EDITORIAL

By E. R. Root.

HEAVY snows have been falling in our locality. This is good for the clovers, without question.

WE desire to get more reports as to whether drouth in the fall kills clover. Then we shall also be pleased to get an article from some one who knows, explaining just what is meant by the winter-killing of clover.

WE have some doubts as to the special advantage of storm-doors or other devices to shut off the light and prevent strong drafts of air from shooting into the entrances of outdoor-wintared colonies. These things have a tendency to confuse, and sometimes clog up with dead bees.

MATTER FOR BEGINNERS.

FOR the coming year we are planning to furnish some special matter for beginners. While, of course, we shall have a great deal of technical reading for the professional and old-time bee-keepers, we shall pay special attention to the wants of the beginner. We have been surprised again and again to notice with what interest even the veterans will read matter designed for the novice, for no one is too old a bee-keeper to learn something new.

ELECTION OF OFFICERS OF THE NATIONAL BLEE-KEEPERS' ASSOCIATION.

The following, from the Secretary, W. Z. Hutchinson, will explain itself:

The following were elected at the late election for officers of the National Bee-keepers' Association: President, Geo. E. Hill-ton; Vice-president, Geo. W. York; Secretary, E. M. Hunt; General Manager, N. E. France; Directors, R. L. Taylor, E. D. Townsend, Udo Toepperwein. W. Z. HUTCHINSON.
Flint, Mich., Dec. 6.

LOW SUBSCRIPTION OFFER.

THIS is the season when many subscriptions will expire. Our readers should remember that we are not permitted to send our journal except for a short time after the expiration of the subscription. In order not to lose a single copy, renewals should come in at once. We are making a special low offer of GLEANINGS one year and Doolittle's fifty-cent book on the production of comb honey, and "How to Control Swarming," both for \$1.00; or we will substitute for Doolittle's book Alexander's articles in book form. The regular price of this series of articles by Alexander in one volume will be 50 cents; but we will club it with GLEANINGS for one year for \$1.00.

GLEANINGS FOR NEXT YEAR.

WE are not making any great promises; but the constant growth of our journal, the increase in the quantity and quality of our illustrations, and the excellence of our contributed articles, should be some index as to what the journal will be for 1909. The editor is planning to make some special trips with his camera, to get new material from men who are successful, but who either have not the inclination to write or feel unable to express their thoughts on paper.

Letters from our subscribers have indicated of late a preference for more short articles in which the actual experiences of bee-keepers are given. Scientific articles are important, and they have their place; but we believe that the majority of our readers will be glad to see fewer long articles and more short ones. We ask our older contributors, therefore, to be as brief as possible.

WINTERING IN A WARM BUILDING.

HAVING occasion to use combs of bees frequently during the winter in giving live-bee demonstrations, the idea occurred to us of keeping one colony right in the office in order to have a hive from which several combs of bees could be taken at any time during cold weather, without inconvenience. Remembering the experience of Mr. Geo. W. Phillips in wintering colonies in a warm room at college, as given in our Oct. 1st issue, 1907, page 1267, we located a glass hive on a window-sill, cutting a hole through the sash for an entrance, about three-fourths of an inch high and two inches wide. Panels are ordinarily kept over the glass so that the hive is dark with the exception of the light that comes in at the entrance. The temperature of the room is not often over 70°.

Bees were taken from the hive, for the first time, about two weeks after it had been located at the window. Although there was no brood in the combs at first, it was found that in the two weeks' time the queen had begun to lay in one

comb, and a considerable amount of brood was well under way.

The bees, contrary to what might be expected, are not restless, but quiet, and apparently perfectly contented. They are not tightly clustered, as would be the case in a hive outdoors during cold weather, but scattered quietly all over the combs, even on the outside of one of the outside combs. The space between the top-bars and the cover is always well filled with bees, and the space outside the end-bars (Hoffman frames) at the back of the hive is also quite often made the clustering-place of many bees. The weather has not yet been extreme; but when it was the coldest the bees withdrew more closely to the spaces between the combs. At times the majority of the bees are in the front part of the hive over the entrance, but usually they are pretty well distributed over the whole hive. The condition seems to be ideal; for, so far, not over a dozen bees have died.

Mr. Phillips found, in his experiments, that the consumption of stores was not large; and although it is too early to tell definitely, it would seem that no more stores should be consumed than by a colony in a cellar, and perhaps not as much. While the bees are not perfectly quiet, they are never restless, since the air from the outdoor entrance is always pure. If brood-rearing continues, even on a small scale, rather more stores will be used; but the greater part of the bees will be young and vigorous in the spring.

The bees show no more tendency to fly out in cold weather than do those in regular hives out of doors. They do not even venture down to the bottom-board in cold weather.

Of course, no extensive bee-keeper could find enough windows for all his colonies; but the house apiary makes it possible to have conditions very much like those that have been mentioned. Who can give us some actual experience with house-aparies in regard to the wintering of bees? Are the results any more uniform than those of colonies in individual hives out of doors? What about the consumption of stores in house-aparies? It is true that the house-apiary is much more common in Germany than in America, and we should like to get at the facts of the question.

SEALED COVERS VS. ABSORBENTS.

SOME years ago there was much discussion as to whether it is better to put the cushions directly upon and over the clusters of bees, or to place thin boards on top (which the bees seal down) and the cushions over these. There are times when the former seems to give the better results; and there are times when the latter seems to give the better showing. But one year with another, in the average locality the sealed cover furnishes the conditions most favorable for winter. When the absorbing cushions are placed directly on the cluster they are apt to become wet by the absorption of moisture, and freeze, when they are but little better than a cake of ice on top of the bees. With sealed covers, if the entrance be of fair size, $8 \times \frac{3}{8}$, the moisture will condense, run down the bottom-board and out of the hive, while the cluster is left clean and sweet and dry; and, more than all else, the cushions on top are dry, and of course are in the best condition to ward off the cold.

For the benefit of those who desire to watch a colony under a sealed cover, a sheet of glass may be substituted in place of a thin board. Over the glass should be placed a good-sized cushion, or a tray of chaff, sawdust, or planer shavings.

THE IMPORTATION OF BEES AND QUEENS INTO HAWAII.

In the Oct. 1st issue, page 1176, we mentioned the fact that some restrictions had been placed on the importation of bees and queens into Hawaii. We wrote Mr. Van Dine, and have received General Circular No. 3, October, 1908. In it we find the following regarding the importation of queens and bees into the island:

RULE 4.—IMPORTATION OF QUEEN-BEES.

In order to prevent the introduction into this Territory of infectious, contagious, or communicable diseases among honey-bees it is hereby ordered that

All queen-bees imported into the Territory of Hawaii shall be subject to the following terms and conditions hereinafter set forth, namely:

(1).—*Labels*.—A label shall be affixed to the cage, box, or other container in which any queen-bee is enclosed, which label shall set forth:

- (a) The number of queen-bees enclosed;
- (b) The locality where each was produced;
- (c) The locality from which each was shipped;
- (d) The name of the shipper;
- (e) The name of the consignee.

(2).—*Request for Inspection*.—The importer shall file with the Board of Agriculture and Forestry, at least two weeks prior to the date at which the queen-bee or bees will arrive, a written statement signed by himself or his agent or attorney which shall set forth his purpose to import said queen-bee or bees into the Territory of Hawaii, which statement shall contain as accurately and fully as possible the following information:

- (a) The number of queen-bees sought to be imported;
- (b) The probable locality where each was produced;
- (c) The locality from which each is expected to be shipped;
- (d) The name of the proposed shipper;
- (e) The address of the importer, and shipping-marks.

Said statement shall also contain a request that the Board, upon arrival of said queen-bee or bees, proceed forthwith to inspect or cause to be inspected such queen-bee or bees.

(3).—*Inspection*.—Immediately upon the receipt of such request for inspection, or as soon thereafter as may be, an inspector of the Board shall inspect each queen-bee; and, if it is found free from such disease, shall cause it to be transferred from any cage, box, or other container in which it shall have been imported, and shall transfer it to a new and clean cage properly supplied with clean and fresh candy, and with sufficient bees known to be free from disease to care for said queen-bee properly.

(4).—*Certificate*.—The inspector shall thereupon give to the importer a certificate of his findings upon such inspection, and deliver to him such of the bees as he finds free from all infectious, contagious, and communicable diseases.

(5).—*Destruction of Cages, Bees, etc.*—Immediately upon the transfer of any queen-bee from any cage, box, or other container as set forth in Section 3 hereof, said inspector shall cause to be burned and destroyed such cage, box, or other container, together with the candy and bees therein, excepting such queen-bee.

If said inspector shall at said inspection find any queen-bee to be infected with any contagious, infectious, or communicable disease he shall in his discretion destroy the same or hold the same for further treatment.

In relation to No. 3 in brackets, on the subject of inspection, it is not quite clear to us how any inspector would be able to determine whether a queen-bee in an ordinary mailing-cage was affected with any bee disease, except, possibly, with paralysis. No queen, unless she were killed, dissected, and examined with a microscope, would show the presence of disease germs. A dead queen in either case would be of no use to any one. It would mean the actual prohibition of sending queens by mail to the islands.

But it is possible to know the locality where the queen was produced, and the name of the shipper; and even then the information would be of but little value unless the inspector were thoroughly familiar with the locality in which the queen was produced. If, however, the queen-

bees came in a nucleus-box or hive accompanied with combs, then the inspector could offer an intelligent opinion as to whether the *combs* were free from disease, but not the bees or queen.

It should be the duty of the inspector to inquire whether the bee-candy put in the cages for the transmission of the queens was made of honey that had been thoroughly disinfected by a reasonable amount of boiling; and it might be wise to go further and recage all queens and bees that come in the mails, burning up the others.

In a further ruling, all foreign honeys are subject to examination before they are allowed to pass into the island. It is proper to remark right here, however, that a microscopic examination might not show the germs of disease—especially so as bacteriologists to-day are not entirely agreed as to what constitutes the cause of some of our diseases. It would seem to us that nothing but a thorough boiling would insure safety, and that would probably spoil it for table use. Inasmuch as honey of good quality is so cheap in Hawaii, there is no probability that any foreign honey would find a market on the islands, as it could not be laid down for any thing like the cost of the domestic article. Resident Americans possibly might be willing to pay a fancy price for clover comb honey, but it would be impossible to inspect this with spoiling it. Under the terms of the rulings it would seem that all foreign honeys would be barred from the islands.

In relation to the importation of bees and queens it will be wise on the part of the prospective importer to communicate at once with the committee on bee industry, consisting of Mr. A. Waterhouse and Mr. P. R. Isenbery; also with the Division of Entomology, Mr. Jacob Kotinsky and Mr. Albert Koebele, Hawaii.

THE DETROIT-CONVENTION PICTURE.

WE take pleasure in presenting in this issue a picture of the members of the Detroit convention of the National Bee-keepers' Association that met in the City of the Straits, Oct. 13 to 15. It was the special property of Mr. W. Z. Hutchinson, who has been and is still selling beautiful large reproductions of it, 20×24, that necessarily bring up more clearly the details than can possibly be shown here. His regular price for the picture is \$1.50 prepaid; but we have made special arrangements with him by which we are permitted to reproduce it in reduced size. Many a bee-keeper will want and should have a copy of the full-sized picture for framing in his home, especially if he is in it himself. It probably contains the faces of more representative bee-keepers—men who are prominent as writers, or who are successful as honey-producers, than any other photo of late years, and it will probably be many a year before we have as many of our leading men again in one group. Our readers will doubtless be glad to get the original so that, in the future, they can see how Mr. So and So looks when his name is seen in public print.

The final stenographic report of the convention is now ready for distribution to the members only of the Association in regular standing. This picture, in connection with this report, will make a very interesting contribution to our literature.

SIFTINGS.

By J. E. CRANE

Mr. Doolittle's advice as to the best material for packing bees for wintering out of doors is sound, and no one will make a mistake in following it. See page 1147.

That recipe for beeswax finish, page 1194, is worth a year's subscription to GLEANINGS. Let's see if we can't remember it—one part pure beeswax; three parts turpentine; wax to be melted, and turpentine stirred in while hot.

Again, on page 1206, Mr. Morrison points out the value of honey in the production of levulose, the value of which has not been very widely known heretofore. How much we have learned about honey during the last year or two!

Those articles with illustrations, such as the one by J. H. J. Hamelburg, commencing on p. 1196, are exceedingly restful and refreshing. How fast the world is coming together and the prophecy being fulfilled, that "there shall be no more sea!"

Wesley Foster's experience in selling honey is certainly interesting, and shows what can be done. I have sometimes thought it might pay to organize and place peddlers of his stamp in every considerable town in the country. Every one would then have a chance to buy this most delicious food. Grocers do not seem to like to *push* the honey trade.

E. D. Townsend says, page 1185, "I have seen a dashing rainstorm cut off the basswood flow when but half over." Are you sure it was the washing of the blossoms that caused the flow to cease? I have several times known the flow from basswood to be checked and seriously injured when the storm was miles away—not a drop falling within range of my bees.

Waxing splints, page 1244, is briefly discussed. There was one thing we noticed in those illustrations of Mr. Atwater's combs. Neither of those that had wires in them was gnawed by the bees, while in both of them having no wires the splints were badly gnawed. Now, he may not have so intended, but somehow I got the impression that such was usually the case.

It is a great source of pleasure to learn from page 1244 that Dr. Miller is not grumbling after taking 138½ lbs. of comb honey per colony the past season. Our crop this season was 22 lbs. of comb honey per colony. The biggest yield I ever had was in one yard where it averaged 100 lbs. per colony. Say, doctor, is there any unoccupied territory in your vicinity?

I agree most heartily with Dr. Miller, p. 1176, that the United States flag should float over the brewery. The government is certainly in company with the brewer, and why not let the world know this fact? The evil is not in the emblem

but in the company. Let the government cease to draw its sustenance from the brewery, and the flag will no longer float there.

On the same page Mr. Morrison speaks of the value of the sunflower for both honey and seed. His statements, I believe, are quite correct. I used to wonder why more was not grown, until some years ago I raised a patch of them, and then learned how rapidly they would exhaust the soil—more so than any other crop I ever raised. With very rich soil or plenty of fertilizers they can be grown with success.

On page 1180 Mr. Holtermann illustrates a winter case for receiving and holding four single-walled brood-chambers. While I have for many years wintered bees in double-walled hives I believe that placing four brood-chambers in one large case is a decided advantage. Mr. Ira D. Bartlett told me a year ago that he had been very successful in wintering his bees in this way. Bees in single-walled hives are much more easily cared for during the warm months.

W. K. Morrison in the Oct. 1st issue of GLEANINGS gives us many interesting facts. In quoting from the Arizona Agricultural Experiment Station, however, he says that "honey makes excellent cider." Wouldn't it have been better to say a substitute for cider? While honey has many good and excellent qualities it does not make cider. Let's keep to the truth. Cider is the expressed juice of apples, and perhaps some other fruits, and in no possible way can honey be turned or changed into such juice.

Mr. Wm. W. Case faithfully portrays the evils and remedies for the ravages of the larvæ of bee moth, page 1199. I can not agree with him, however, that these larvæ will live for a long time on the footprints of the bees. It is just dirt or dirty wax brought up from below, and mixed with the wax, and which contains an exceedingly small percentage of nitrogen. I have found that, where such cappings are badly perforated and eaten, a good brushing with a rather stiff brush will greatly improve the appearance of the combs.

I am sure the bee-keepers of the country ought to be very grateful to Mr. Morrison for the many facts he has given us the past season in regard to honey and sugar, the value of honey as food, and the difference between cane and beet sugar. See pages 1248, 1249. A year ago I wintered most of my bees on raw cane sugar. Two yards wintered better than I ever had them before, except that in one I did not feed enough, and some starved. In other yards the bees suffered from poor honey stored before I commenced feeding.

On page 1245 Mr. D. Everett Lyon deems it a great injustice to bee-keepers that they should not receive pay for their tin cans in which honey is packed and sent to market; he also thinks it unfortunate that buyers should insist on the use of tin cans. Well, if Mr. Lyon had dug honey granulated solid in cold weather from a few 600-lb. barrels he would see a reason for bottlers

of honey wanting their honey to come in five-gallon cans that could be quickly placed in a tank of warm water to liquefy, and then be poured or pumped into a large tank for bottling. But why should not the buyer pay for the cans? Where the buyer pays $\frac{1}{2}$ cent more for honey in tin than in barrels he does pay for them, does he not? and if he does, why should he not keep them and sell them to whoever he pleases? Again, it may be said that all goods sold include with them the container in which they are packed—barrels with apples or sugar, pails with lard, tubs with butter, etc. The farmer who sells a barrel of apples for \$1.75 sells his barrel with his apples, although it may have cost him 35 cents, or one-fifth of all he gets. The honey-producer sells a case of honey for 8 cts. a pound, and receives \$9.60 for it, cans and honey. His cans, if new, doubtless cost near 60 cents a case, or just $\frac{1}{16}$ of what he gets. While the farmer loses one-fifth, the honey-producer loses but one-sixteenth. Sometimes crates are returned, as egg or fruit crates. As to selling used cans when in good shape, and free from dust, I see no objection. We sold, the past season, a large number of such cans for 25 cts. each. Those who bought them doubtless saved just about that much by buying them. Some of these we have bought back filled with new honey, none the worse for being packed in second-hand cans. Rusty or leaky cans should not be sold at any price. Again, there are some markets where the producer would find that it would pay better to use only new cans, as in cases where the honey is to be sold in the cans as received.

There is another thing in this connection I should like to speak of, and that is that much honey is lost by shipping it in cases too fragile to stand the journey, or with nails driven into the tin cans, or with caps not tight.

CONVERSATIONS WITH DOOLITTLE

WINTERING IN A CELLAR.

"Mr. Doolittle, I want to know the best time to set the bees in the cellar for good wintering. When we had that little snow about the middle of the month, I came near putting the bees in, but did not. Have you put yours in yet?"

"Yes, we put ours in just after the snow went off, waiting till every thing had nicely dried from the melting snow; and as there was no frost, and the ground was not frozen, the hives could be picked up as quietly as I ever knew, the bees not knowing that they were moved, unless by some mishap an occasional hive was jarred a little. It is quite a treat to get bees in so quietly."

"But was not the middle of November too early to put the bees in during such a warm fall as we have been having? My bees have been flying nearly every day for a week, and I have been congratulating myself that I did not put them in."

"Could we have known just what the weather would have been, perhaps it would have been as well to wait; but suppose winter had set in with that snow, as it more often does than otherwise,

then we would have had to carry in the hives all covered with snow and ice. It would also have been necessary to pry them up from the frozen ground, and the disturbance and dampness which would have existed under the circumstances would have tended toward very poor wintering."

"But would not the flights the bees have had more than overcome those things?"

"I do not think so. The bees had a good flight on the third of this month (November), and I doubt whether these later flights would have been of any practical use to them. In fact, I have had reason to believe that many days of flight during the late fall are a detriment rather than otherwise; for with so much activity after all breeding has ceased, there comes a consumption of honey and loss of vitality which can not be made up till the following spring; and by that time the bees are much nearer being worn out by old age than they would otherwise be, so that we have spring dwindling and its consequent derangements very much the same as after what is known as bee-diarrhea. With one good flight the fore part of November I always consider it better to get the bees in their winter quarters the very first good opportunity thereafter."

"Well, if that is correct you would advise me to put mine in at once, would you not?"

"I certainly would; and I would not wait longer than this afternoon about doing it, either, as it will be as good a time as you will be likely to have, as it is not freezing outside as yet, though the mercury is down to 36."

"There is another thing I wish to know about. Is it well to give the whole entrance to the hives when the bees are in the cellar, or would you contract the entrances part way?"

"If your hives have the bottom-boards nailed fast to the body, the best you can do is to give the whole entrance; but, if I am correct, very few of our practical bee-keepers of to-day use any thing else than a movable bottom-board. Our bees have a two-inch space the whole width of the hives during winter, and very many of the colonies cluster down below the frames till the bottom of the cluster rests on the bottom-board. They seem to enjoy themselves in this space, if I may judge from the splendid results."

"Do you allow any one to go into the cellar besides yourself?"

"Certainly; come on. I prefer a candle to any thing else for a light, as it disturbs the bees less, and I can hold it close up to where I wish to look. There! see that cluster under there, hanging down something like the crown of your hat till they touch the bottom-board."

"Yes. They do not move or stir more than dead bees."

"You watch them while I breathe on them. There! do you see the wings move and the stings come out? We'd better leave this hive now or they will soon be flying at the candle? See, here is a large cluster in sight, nearly as big around as a peck measure. See those rows of abdomens jutting down between each range of combs, each as immovable as though riveted there."

"But do they stay like that all winter?"

"They usually do until March, when they are not as quiet as now; that is, they will not stand the light as long at a time as now. Although the temperature remains the same, and the dark-

ness is the same, they seem to know that spring is near. The longer they stay in after the middle of March the more easily they are disturbed as each week passes, till they can go out to enjoy the commencement of another season of activity."

BEE-KEEPING IN THE SOUTHWEST

BY LOUIS SCHOLL

Merry Christmas and a happy New Year. The old year will soon be gone and a new one will begin. Has the old one been a profitable one to you? If not, why not? If it has been a profitable one, why was it? and what plans have you made to make the coming year even more profitable?

It seems a pity for a bee-keeper to melt up his old combs every four or five years, page 1366. One feels too much as Dr. Miller does about giving them up for sheets of foundation; and this will, I fear, be the trouble with too many in places where bee diseases prevail. Rather than melt up the valuable (?) combs, and thus gain just so much toward saving the bees from destruction by disease, they will be retained. We are anxious to see the figures that are forthcoming. We must confess ourselves that even we are somewhat stingy about our *good* combs unless there's something in it for us when melting them. [The figures referred to are given on page 1425, last issue. If there is no suspicion of disease in the locality, and the combs are straight and good, we would not advise any one to melt them up.—ED.]

FALL ROBBERING IS DANGEROUS.

Care should be exercised to prevent robbing late in the fall. It has a wearing-out effect on the bees. This is in reference to wholesale robbing, or a robbing-spree, which often occurs through the negligence of the bee-keeper, though sometimes due to some avoidable accident. Of course, it also happens that the bee-keeper can not always avoid such wholesale robbing. We had such a case only last week. Since we haul nearly all of our honey home, where it is put up, the bees are always on hand, and soon show up by the thousand. They've been spoiled several times, and are always looking for another chance, even on very cool days, wearing themselves out unnecessarily when they should be in their "winter-quarters rest."

QUEENLESS COLONIES LATE IN THE FALL.

It is a waste of time to look for queenless colonies late in the fall; and, besides, opening colonies when the bees are all at home starts robbing in a short time. When we find a colony queenless, or very weak from some other cause, we simply set it on top of another strong colony. The combs will be taken care of, at least, while otherwise moth larvæ might destroy them before we could make another visit to that yard. With many yards to attend to in a busy season we found long ago that tinkering with weak or queenless

colonies does not pay, and the above is the quickest way to dispose of them. Later the hives and combs may again be used for increase. During the late fall, only such are disposed of as are easily seen to be weak or queenless by simply walking through the yards. All others are left to take care of themselves until the following spring. If they die out in the mean time the combs are safe from the ravages of the moth larvæ. They must, of course, be taken care of promptly during warmer weather.

BREAKING THE RECORD; REMOVING HONEY.

On page 1251, mentioning some of the good qualities of the shallow supers, reference was made to the fact that it was possible to remove from the hives a thousand pounds of honey in half an hour. This has brought me several letters from doubting ones, who question my "bold statements." Since the previous mention was made, however, I have been placed in position to make even bolder statements—that *with the shallow-frame supers I can remove a thousand pounds of honey from the colonies all by myself in twenty-three minutes.* This was done on a cool day in October. My watch lay on one of the hives. Had the bees moved out more rapidly the time would have been shortened; but they were "a little stiff," and had to be forced down with smoke in greater quantity.

Not only did I get letters of a doubtful nature as to the previously mentioned fact, but one person came himself from a distance to see this wonderful (?) stunt, and to go right after the truth. It was November by this time, and the air quite cool. The bees were quite numb, but with a little assistance in the way of smoking, 1140 lbs. of fine comb honey was removed in 17 minutes. In the summer a helper and this "6 feet 2" removed 1050 lbs. in a little over 10 minutes. That's taking honey off in a hurry as against the old method of brushing and shaking bees off the deep combs, etc.

A PLEA FOR BETTER HONEY-CANS.

Before Texas producers make arrangements for honey-cans for next year I wish to get in touch with the bee-keepers of the State, especially the members of the Texas Bee-keepers' Association. In some correspondence with railroad officials I find that the loss of honey *en route* to customers is something enormous. If this is allowed to go on, bad results must necessarily follow. First, the railroads will begin to object to paying claims for damaged-honey shipments; and, second, the buyers, especially the merchants, will object to handling a commodity that comes damaged to such an extent that they can not handle it profitably. These matters are not as well understood by the average bee-keeper, but must obviously be learned in time.

The railroad companies are considering this matter now, and are looking for a remedy. To accomplish any thing, they must get in touch with the bee-keepers who know and understand the situation. They are willing to handle the honey as freight, but not at a loss; and to find the remedy the cause must be located. If it is in the package used, it must be made stronger; if in the handling of the freight *en route*, then the mat-

ter must be looked after on that side. For this reason I shall be glad to receive letters from all those who have had experience in shipping honey, and especially those who have had damaged shipments, etc. All items that may be of importance toward helping to remedy the trouble should be mentioned.

From my own experiences and observations in shipping honey for sixteen years, and seeing it shipped by others, I find that the shipper is often at fault, while at other times the fault rests with the railroad people in the handling of the honey. In the former the trouble lies in that too much honey is shipped in cans of inferior quality, placed in wooden cases that do not hold together under the great weight. I have learned that from my own experience, when I used the same kind of cans and cases. The greatest trouble is due to too light cases being used to hold the heavy cans of honey. Therefore this should be looked after, and remedied another year by using heavier boxes or cases, looking also to the quality of the cans as well.

There are instances, too, of rough handling of the honey on the road by the railroad employees. If substantial packages are used in the first place, however, then the railroad companies can be held responsible for damaged shipments due to negligent handling. The long distances that honey must be shipped here in the South, with the many transfer stations, together with more or less careless handling, makes it important that we look to good strong packages for shipping our next year's crop of honey.

There is a danger that confronts us, as producers and shippers of honey, if we do not attend to this matter promptly. It is of vital interest, as the loss of honey in shipment is so great that it not only costs the railroads a great deal of money each year, but in the end works to the detriment of the producers. Furthermore, the buyers who receive shipments only slightly damaged, and do not present a claim for the loss, may be turned against buying a commodity on which they must lose, hence will not buy again. So let us take up the matter together. Letters on the subject will be welcomed.

SPRING MOVING OF BEES.

All jokes aside, Dr. Miller, here is one who believes it is often better to wait till spring to move bees. I have tried it several times, and with better results. Did you ever notice colonies of bees in an apiary which has been in one place a long time become so "sot in their ways" as not to give best results? They seem to get settled down into a rut—don't do so well as new, vigorous, hustling colonies generally do. I mean this of colonies that are not manipulated very much, but remain on their stands the year round, receiving only their supers, etc., and having the surplus (which for the above reasons is not the greatest amount) removed. Leave them on the same stand next year, and they are the same; they seem slow and sluggish. Move them to a new place in the spring; stir them up, and note how much better they work. I compare them to people who have tired of their old home, have moved to a new one, and have become invigorated with new life. At the old place they were in a

rut; every thing was left to go its way; at the new, they gain a new interest; every thing is overhauled and put into better condition. The same change has an effect upon the results of the occupation, whatever that is. With bees it will be noticed very easily, if one buys a neglected apiary and moves the colonies to a new location the following spring. If moved in the fall the bees remain more or less in the old rut, or get back into the same old habits before the following spring through the long winter. The stirring-up of the bees rouses them, and the excitement causes them to use their stores, so that they are stimulated to heavier brood-rearing. The result is a rousing colony of bees and a greater amount of surplus. The best time for these moves, I find, is just long enough before the expected-honey flow to allow the young bees, raised on account of the move, to be old enough for it.

GLEANINGS FROM OUR EXCHANGES

By W. K. MORRISON

SACCHARINE — BEWARE!

That reliable journal, *The Louisiana Planter*, is responsible for the statement that saccharine is being sold right now in New Orleans. It says: "And it is doubtless utilized by manufacturers of syrups as a cheaper way of obtaining the necessary degree of sweetness, without paying the cost of the proper sugar to produce the desired sweetness."

This is an important statement, as the general effect of saccharine is equal to a slow poison by causing the food to remain undigested. It neutralizes the action of the digestive ferments, and in this respect resembles formaldehyde. Bee-keepers will be obliged to register a protest against the sale of this insidious substitute for real sweet. We ought to have a national law prohibiting its sale for food, and even its manufacture should be regulated. It is derived from coal tar.

DEATH OF A PATRON OF APICULTURE.

The death is announced of M. Leon de Bruyn, formerly Belgian Minister of Agriculture. He is very gratefully held in remembrance by Belgian bee-keepers, because during his term of office he did so much for the bee-keepers of his country, being extremely liberal in giving their societies needed assistance. With the exception of Switzerland, Belgium stands higher, perhaps, than any other country in the way the bee-keepers are organized for mutual assistance and defense. Six bee-journals are maintained, and bee-keeping is taught in the agricultural schools in very good style. Bee-keeping is followed in a scientific fashion, and every thing is done to promote a truly efficient system of keeping of bees. This healthy state of affairs is in no small part due to M. Leon de Bruyn. He was 70 years old when he died, and was a member of the senate.

NATURAL-COMB BUILDING IN A HIVE MADE ENTIRELY OF GLASS.

THE BEE AS A SUBJECT FOR NATURE-STUDY.

Natural Honey-comb.

BY EDWARD F. BIGELOW.

Most of us apiarists who lay stress on the economic point of view have buried the natural in the artificial. How few who have confined their attentions to the right-angled frames of the modern hive really know what honey-comb is? Of course, now and then it is seen when the bees recklessly build in some section where the starter was not in good shape, or when they build in some portion of the hive not filled out with frames. Most bee-keepers at some time in their life have satisfied their longing for the wild in a fascinating ravaging of a bee-tree. Within such a hollow the honey-bees are themselves. Here they plaster and twist and turn and press, and extend upward and downward in most delicious bendings. It is easy to make a transparent hollow-tree, or, in other words, to have a hive into which one can see through top, sides, and end, and so that the bees can build in any manner to suit their fancy as freely as they could in a tree. All that is necessary is five pieces of glass of almost any size that is preferred; but the five pieces must be so related to each other that they may be assembled to form the top, the two sides, and the two ends of an inverted box. The pieces of glass are easily held together by passe-partout binding. Fasten to a board some form of rustic branching to

suit one's fancy, and invert over it the glass box. Then the fun begins. The bees are unhampered. As soon as the swarm has been put into the box the bees begin work to suit themselves, not to please Mr. Hoffman nor any other person who would restrain the natural traits of the honey-bee within artificial limits.

Herewith is a photograph of an excellent example of honey-comb within one of these passe-partout hives. I have spent a good deal of time with various forms of observation hives, but have come to the conclusion that, for watching and studying the honey-bee when from every point of view it is unhampered, there is nothing like this simple inexpensive glass box. There is surely nothing more convenient for observation from every side, and nothing wherein the honey-bee is left so thoroughly free to pursue her own sweet will. It is really an old-fashioned box hive made transparent.

Of course it is necessary to keep such a hive within doors. Warmth and darkness may be easily provided by blankets or some other opaque cover thrown over the hive when its interior is not to be examined.

Try one and "live happy for ever afterward."

HONEY-BEES AND POLLEN MASSES.

There is no more interesting question pertaining to honey-bees than the manner in which they gather pollen and carry it on their legs; and the more closely one watches the bee on a flower, the more deeply is he puzzled to know exactly how the work is done. The closer the view of the

POLLEN MASSES ON LEGS OF BEES.

Several show side hairs (like stakes on a hay-wagon), to hold on the load.

BEES WITH MASSES OF POLLEN ON THEIR LEGS.

Note the bee in the lower right-hand corner, with two masses of pollen almost as large as its body.

legs and the pollen masses, and the greater the magnification used for the observation, the deeper becomes the wonder as to the whole process. Bees cover themselves with pollen so that frequently when they fly from bloom to bloom the particles drop to the ground. Yet notwithstanding this apparent haphazard gathering there is a method in the process, since some of the pollen is regarded as mere litter, while the rest is a desirable load, for a certain definite amount is, by a mysterious process, transferred to the place designed for it on the flattened legs.

One bright and beautiful day in May I noticed that the bees were coming in with loads larger than usual, and that these were not uniform in color. There were various shades of yellow and orange, and now and then a bee arrived with a burden that was deep pink or even red. I immediately got my collecting-bottle with a liberal supply of chloroform. With bottle in one hand and tweezers in the other I stood over the open hive with two or three frames out. As here and there I saw a honey-bee running with a liberal load, I picked her up and put her in the sleep-bottle. The chloroform immediately quieted the captives and prevented them from dashing about the

bottle and shaking off the pollen masses. Then I took the pile of bees and photographed it to show that the masses were huge in comparison to what one would suppose the bees could carry. In some cases the two masses were almost as large as the abdomen of the bee that was carrying them. The photograph shows the location of the packing on the legs, but it is to be regretted that the art of photography does not yet show color. The pile as it lay before my camera was indeed beautiful. I then removed some of the pollen masses and scattered them along on the "optical bench," placing a thimble so as to show the relative size, and took another photograph as is shown herewith. So far as my observations extend, there are never two colors of pollen in any one mass. I took pains to crush or (with a needle) to tease apart some of the masses, but I could not find a single instance where there was more than

MASSSES OF POLLEN TAKEN FROM LEGS OF BEES.
These were photographed with a thimble to show the relative size.

one kind of pollen in the same mass. It is true I believe that the honey-bee gathers only one kind for each load; but it is not true, as I have sometimes heard it stated, that all the bees of the hive work at one time upon one kind of flower. The conditions in regard to pollen-gathering make this self-evident; and since many bees were coming in laden with nectar, it seems probable to me that there was as much diversity in the variety of nectar as there was in the variety of pollen.

Here is a wide field for further experiment, and I intend to work in it extensively next summer. I am wondering what materials will be accepted by honey-bees as a substitute for pollen. One of the most interesting communications that has come to me along that line is from a child who wrote me that her mother scattered red pepper on a certain flower-bed in early spring to keep the dogs from digging it up. To the great surprise of my correspondent and of her mother, the bed was immediately covered by honey-bees, and, so far as could be observed, they were carrying off the tiny grains of red pepper, picking them out

thicker than usual, yet it seems to be something more than jelly, being more like a very thin wax. It surely does not appear to be material on the egg, for a careful examination shows that there is nothing adhesive on either end of them. I must confess that the process is not yet clear to me, but it is indeed interesting to have a side view of the bottom of a cell, and to see the egg standing erect on the tiny "teeing" mass of supporting material. The egg is curved, and a curious thing is that it seems to develop unevenly throughout its length, doing so more rapidly at one end than at the other. As this development continues, the egg from above downward becomes limp, and gradually turns down in a way that is somewhat similar to that of a wilting plant which bends first at its tender tip, the withering gradually extending down the stronger stalk. This bending, although the resemblance is remote, reminds me of the skunk-cabbage fruit which slowly bends downward as winter approaches.

This is a wide field for investigation, and one that is fascinating. I show herewith by a photomicrograph a curved egg in position at the bottom of the cell. It required a great amount of time and much careful manipulation to produce this, and, notwithstanding my pride in it as an excellent specimen of photomicrography, I must admit that it is far from doing justice to the subject. When magnified under a strong reflected light, eggs are beautiful objects, as they are apparently enveloped in filmy lace, which can not be shown in a photograph, as I have not been able, after repeated attempts, to picture these reticulations. It is, indeed, not shown to advantage on the ground glass, and, of course, if it does not appear well there it can not be transferred to the sensitive plate. A view of it under the compound microscope shows it to be a superb object.

I often wonder why so many collectors of birds' eggs rave over the wonderful beauty of those objects, and become so interested in collecting them. No birds' eggs with which I am familiar are so interesting as the eggs of insects; and among these, so beautiful in form and in ornamentation, none seem to me quite equal in attractiveness to the eggs of the queen honey-bee.

Stamford, Conn.

EGG OF THE QUEEN.

This was photographed in position (on end) at the bottom of the cell.

from among the particles of earth. If honey-bees like that kind of food they will surely maintain their reputation for "hotness" in more senses than one.

THE EGG OF THE QUEEN-BEE IN POSITION.

All who have had any experience with honey-bees have observed the workers cleaning out the cells, after which the queen hovers over them, and, after a little hesitation, backs with her curved abdomen into one of these renovated apartments and there deposits her crescentic egg. I have always been desirous of seeing in microscopic detail exactly what happens at the bottom of that cell, and how the egg is held in position. It appears that there is a tiny particle of a sticky material in the bottom of the cell, and I am disposed to think it is placed there by the worker bee, and that it is of the same material as the royal jelly, or of some very similar substance. Perhaps the royal jelly has been made a trifle

[In regard to the manner in which eggs are attached to the base of the cell, it is interesting to note what some of our standard authors have to say. Cowan, in "The Honey-bee," says: "She . . . deposits at the base of the cell, to which it is attached by a glutinous secretion, a little bluish-white oblong egg." Cheshire, in "Bees and Bee-keeping," Vol. I., makes the definite statement that "The oviducts are provided with secretion cells, which coat the egg with an agglutinative body, so that, as it leaves the queen, it adheres by its smaller end, as before pointed out."

These opinions indicate that the adhesive substance is on the egg and not on the base of the cell. It seems probable that this is the case, since

ONE OF THE OUTYARDS OF W. L. COGGSHALL.—PHOTO BY VERNE MORTON.

eggs laid by inferior queens are often attached to one of the sides of the cells rather than to the base, and it is hard to conceive of workers placing the adhesive material on the sides, only for a defective queen.—Ed.]

W. L. COGGSHALL.

The Man and his Methods of Management; the Most Extensive Bee-keeper, Per- haps, in the United States.

BY E. R. ROOT.

While in attendance at the Detroit convention I met Mr. W. L. Coggsall, of Groton, N. Y., whom our older readers will remember as being, probably, the most extensive bee-keeper in the United States, or at least that was the title he had earned several years ago. Prior to that time, Capt. J. E. Hetherington, of Cherry Valley, N. Y., held that honor; but during his later years, owing to ill health, his bee-keeping interests diminished while those of Mr. Coggsall, of the same State, materially increased. At one time the latter owned one or more apiaries in the West, and some eighteen or twenty yards in his own State, and one or two in Cuba. I do not know at the present time how extensive his holdings are in bees; but it is my opinion that, during the four bad years that have recently held sway over Cuba, his interests there have materially shrunk.

HIS MANAGEMENT OF OUTYARDS.

Our friend W. L. Coggsall, in connection with his brother David, has a larger interest in bees in New York than perhaps any other two men. They believe in the out-apiary plan, keep-

ing from 50 to 100 colonies at a yard. At each of these places there is a small building with a complete extracting equipment, for the Coggsalls run almost exclusively for extracted honey. Bees are wintered mainly in outdoor double-walled hives. Some of the hives are on the tenement plan, and some hold only a single colony. The yards are located as advantageously as possible in the fruit sections, and anywhere from a mile and a half to three miles apart. The most remote yard at the time of my visit several years ago was something like twenty miles from home. Owing to the lay of the land, and the lakes in the vicinity, it is not possible to arrange all the apiaries so that they will radiate from a common center like the spokes of a wheel. The apiaries, as I remember them, were located in a valley between parallel lakes north and south.

No man is kept at any of the yards to look after swarms; for with Mr. Coggsall's management, providing he is not too much crowded, there will not be many swarms. The yard helpers all live at the Coggsall residence, which is shown in the small picture herewith. By this it will be seen that Mr. Coggsall is an extensive farmer; and when work is slack in the bee-yard the boys are turned loose on the farm. During the season the men are divided into one or two groups, sometimes going with the horse and wagon, and sometimes going on bicycles. It often happens that one of the men will take the wagon while the others will take the wheels to the yards. The wheelmen get things well started, so that, by the time the wagon arrives, a good portion of the honey for the day is taken off. After extracting one yard the gang will move to another one, sometimes extracting two whole yards in a day, and that, too, with a non-reversible extracting-machine of the Coggsall pattern.

AN OUTYARD OF W. L. COGGSHALL, SHOWING TENEMENT HIVE USED.—PHOTO BY VERNE MORTON.

HIS INTENSIVE METHODS.

The boys are all trained to work rapidly, even if a few stings are received; for it must be remembered that the Coggshall "lightning operators" all wear sting-proof suits and veils, long sleeves reaching down somewhat in the form of a fingerless glove protecting the hands but not the fingers, for the fingers are seldom attacked. The combs are brushed and shaken to free them from bees. Bee-escapes would be impracticable with the method in use by Mr. Coggshall, for the reason that it is impracticable for any one to go to the outyard and put on bee-escapes the night before.

This rapid method of taking off the honey naturally irritates the bees, and this has an advantage in one way at least, for the yards are seldom or never molested by thieves; for should a tramp or other person not familiar with the Cogg-

shall bees attempt to help himself he would meet with a "warm reception."

COGGSHALL AND THE VICIOUS BULL.

At one time a vicious bull felt inclined to give Mr. Coggshall more or less trouble every time he attempted to go to a certain yard, for he had to cross the field to get to the bees. Now, Mr. Coggshall knew the temperament of his pets; but Mr. Bull followed him up and began pawing the air as if about to make a rush. Our friend edged along toward his apiary until he got near one of his hives. In the mean time the bull was closing in, apparently awaiting a favorable opportunity to make a charge. Mr. Coggshall grabbed up, at the strategic moment, a hive from its bottom-board, rushed at the bull, and threw it violently on the ground. The frames, well covered with bees, were of the unspaced type, and fell in a tangled heap on the ground within a few feet of old Taurus. The effect was almost instantaneous. The bull changed his roar; he sniffed and snorted, rubbed his nose in the grass, then wheeled, raised his tail, and started on a mad run away from his little tormentors, a sadder and wiser bull, leaving Mr. Coggshall in undisputed possession of the field. Never after that time did that bull venture to interfere; and even when teased to make another attack he was "mighty tame" as the boys said.

HOW COGGSHALL TAKES OFF HIS HONEY.

But, to return, I said the combs are brushed and shaken from the hives. They are next set down into hive-bodies on a wheelbarrow or hive-cart. When I visited him he had four of such hive-bodies standing on a two-wheeled cart.

RESIDENCE AND FARM BUILDINGS OF W. L. COGGSHALL, GROTON, N. Y.—PHOTO BY VERNE MORTON

When these were full of combs they were wheeled into the extracting-house, and a load of empties brought back to take the place of those removed.

HIS METHOD OF WINTERING.

Mr. Coggsall, notwithstanding the general practice of bee-keepers in the vicinity, of wintering indoors, keeps his bees outdoors in double-walled hives, and there they are left the entire year. His apiaries are worked on the intensive plan, being visited only a few times during the year—in the spring, during the extracting season as often as needed to take off the honey, and once or twice in the fall to put the bees in condition for winter.

HOW HE HANDLES THE SWARMING PROBLEM.

While I was visiting some of Mr. Coggsall's neighbors, one of them said he knew of one yard where he thought Coggsall had lost a good many swarms. I mentioned this to Mr. C. in a later interview, and he told me that that yard was remote from his home, and that season it had been somewhat neglected, owing to his inability to get help. The bees had become overcrowded, and, of course, swarmed. "But," said he, with a twinkle in his eye, "I could better afford to let, even under these conditions, a few swarms run away, than to hire a man to see to the bees all the time, as is the practice of some bee-keepers. At the price my honey brings, I can not afford to keep one man for each yard; and for that matter I do not believe any one else can if he stops to figure up the costs. But," said he, "I can

raise bees for fifty cents a colony; and suppose eight or ten swarms do go, only five dollars is lost, and that would pay a man for only half a week's wages. No, sir; my help and four or five men can manage the whole twenty yards, and do considerable other work."

HOW HE SUCCEEDS WHEN OTHERS FAIL.

Mr. Coggsall is a genius in that he will buy up yards that do not pay their owners to run, and very often in one season he will make that lot of bees give him a good profit in one season over and above the cost of the yard; and, stranger still, he will make those bees pay in any frame or hive, although his preference is decidedly for the old-style Langstroth frame with a staple at the bottom of the end-bar, and the ordinary Langstroth hive.

Mr. Coggsall has been a very hard worker in his day; but during the last few years he has found it necessary to husband his strength, as he found he was overdoing. I believe he now simply furnishes the "brains" and lets his men do the work.

WORKING THE BEES AND THE FARM.

I do not know how he manages to prevent his farm and bee work from conflicting; but I am of the opinion that he does it on the basis of growing certain crops, the harvesting of which will not interfere with his extracting season; for it must be remembered that his main honey crop is from buckwheat, and that most of the extracting takes place some time after the main honey harvest of clover and basswood.

THE ALEXANDER APIARY, FROM THE NORTHWEST.
There is probably not another apiary in the world consisting of 700 colonies.

THE LAST DAYS OF E. W. ALEXANDER.

**Details of a Visit as Told by a Friend;
Japanese Buckwheat not Considered
as Desirable as the Silverhull.**

BY PERCY ORTON.

Being desirous of enlarging my home yard to its full extent I made a trip to the home of my friend E. W. Alexander, to see the farms and growing buckwheat, in order that I could better compare it with our own section. The distance is about 50 miles. On the trip I passed through Mayfield, the home of George W. Haines, and I could see through the car window his apiary of 150 colonies. Mr. Haines is situated near the lower Adirondacks, about ten miles west of my home, in a very fine location. He harvested about four tons of extracted and comb honey this year.

I also went through Johnstown, the home of Mr. Chas. Stewart, the State Bee Inspector for this section. Mr. Stewart has started a yard in the city, and has in his four yards about 450 colonies. From Schenectady to Delanson, a distance of 15 miles, I estimated the number of acres of buckwheat, and I could not count more than 45

acres. I am a farmer, and can judge the size of fields fairly accurately.

I arrived at Mr. Alexander's home about 11 A.M.; took dinner and had a good visit, but was pained to find him in such poor health. However, he felt just as free as he always did to tell any thing he could to help another bee-keeper.

He was very much interested when I asked him if the farmers liked Japanese buckwheat as well as silverhull or gray, and if his bees worked on it as well as on the latter. He said the farmers did not get as many bushels per acre from the Japanese buckwheat, as it grows so many false kernels, and he said that he would not give 15 cts. an acre for it as a honey-producer—that his bees would fly right over fields of the Japanese to the silverhull and gray. I was glad to hear so noted a bee-keeper say this, as I have found by years of experience with both that the Japanese is not as good for honey as for flour, the yield of flour on an average being but 20 lbs. per bushel. All through our valley we grow silverhull, and get from 25 to 34 lbs. of flour per bushel, and plenty of honey.

I looked over the buckwheat-fields that could be seen from the apiary, and came to the conclusion that the 700 colonies of bees never reach one-fourth the buckwheat that many people think they do. I don't mean to say any one has mis-

represented any thing, but I believe that most bee-keepers can keep four times as many bees in one yard as they do now.

Before closing I want to say a little about black brood. If any one finds his combs are affected, the queen should be caged and empty combs or frames of foundation placed above the zinc over the old hive, and the queen released into the top story. In 30 days the

ALEXANDER HONEY-HOUSE AND APIARY, FROM THE SOUTH.

honey from the old hive can be extracted and the combs used anywhere in the yard. If the colony is of fair size to start with the plan works well with me.

Northampton, N. Y.

BEE-KEEPING IN CALIFORNIA.

Prices in 1909.

BY M. H. MENDLESON.

There are a few carloads of amber and light-amber extracted honey remaining in the producers' hands in this part of the State. The best sage comb honey is at a premium; there has not been such a scarcity of this grade for years. The market will be well cleaned up by another season; and since there was considerable loss of forage in the East from drouth and fire, prices for 1909 ought to stiffen.

Prices here are now ruling high. White honey is at a premium; comb honey is scarce, and the demand extra good.

OLD HONEY OF GOOD QUALITY.

Dr. Miller, p. 1303, I have sage honey 14 years old, and the flavor is better than when it was extracted. It is delicious. I have had sage comb honey, kept in dust-proof shipping-cases, in a warm dry room, free from odors, for a number of years, and the flavor improved. It was superior to any fresh comb honey I had ever eaten.

PHACELIA FOR HONEY AND FORAGE.

Replying to Dr. Miller's Straw, page 1243, Oct. 15,

I will say that I have noticed two varieties of phacelia. The better honey-producer of the two has a floral stem of a shape and size that might be compared to a large caterpillar. This variety has an abundance of purple bloom. The honey is water-white, and of fine flavor; but it candies, soon after it is extracted, to the consistency of fine paste. I was at one time extracting some of this honey, putting it in a seven-ton cone-tank, and before the tank was full the honey commenced to candy at the bottom; and when full I had to run a pole down to the faucet before I could get the bulk of the honey to run into the 60-lb. cans. I had to shovel out over two tons with a long-handled shovel. I then had to tip the tank on its side and fill open-top five-gallon cans so that the honey could be melted on the stove. This was an experience with candied

honey that I shall always avoid hereafter. I drew off considerable of the honey while extracting, but the work was all done within ten days. I never had honey candy so rapidly.

In regard to phacelia as forage, I will say that cattle will eat it when the better forage gets scarce. It grows wild on the mountains, especially after a fire, and also when stock eat the pasture off clean. Of course, when stock keep the pasture fed off too close it kills or destroys, as the source of seeding is destroyed.

HONEY FROM IRRIGATED ALFALFA.

Hanford, Cal., produces an average of 53 carloads of honey a year. Hanford is about 250 miles north of Ventura Co., in Central California. The honey is gathered from the irrigated alfalfa, and is light amber in color, but pleasant in flavor.

COLONIES WITH PLENTY OF STORES FOR WINTER ARE THE STRONGEST IN SPRING.

On my ranges I like 40 to 50 lbs. or more of honey for winter stores. Colonies with good vigorous queens, and rich in stores in June and July, continue brood-rearing much later, and go through the winter strong in numbers, and with vigorous young bees. In spring they are ready to swarm early. Other colonies, with scant stores, quit breeding early and come out weak in numbers,

HOME OF FRANK ALEXANDER, NEAR DELANSON, N. Y.

and the seasons are well advanced before they get in the proper strength for business; or, in other words, the strength in spring depends on the amount of stores left on the previous season. The extra honey is money on big interest; for if we have a cool, cloudy spring, there is but little check in brood-rearing. The past three years we have had these late cool springs, and those few colonies with extra amount of honey, gave rich results.

Previous to 1905 the majority of my bees were at the coast. I did not get half the surplus I should have secured, on account of the heavy fogs and cool coast winds. The fogs did not rise until about 10 A.M., and sometimes whole days were foggy. In such cases, bees have much less time to gather nectar, and that which they do bring in does not evaporate so well, and invari-

THE HONEY-TANKS UNDER MR. ALEXANDER'S EXTRACTING ROOM; EACH OF THESE TANKS WILL HOLD FIVE TONS OF HONEY.

ably granulates. I had one of these locations that, in good seasons, never gave me over 75 to 150 lbs. of honey per colony, while those away from the coast would give me over double that amount. In 1892 (a poor year) the coast bees secured plenty of honey for the winter, as they had considerable old stores on hand in spring. The queens were superseded by better stock. I put on extra supers of fine worker comb, and many of my neighbors extracted some honey, some taking off from one to two tons, to their sorrow afterward. In the fall some had to feed back to keep the bees from starvation. My bees were left with 50 to 150 or more pounds of honey per colony, and in spring they came out rich and strong with vigorous young bees. We had the usual foggy weather and an unusually cool backward spring. The bees got only enough to stimulate brood-rearing. The results were, that all this great amount of surplus left over the previous fall made it possible for the colonies to rear a tremendous force of bees. In a few days we had clear weather, and the honey just flowed in at the rate of over 300 lbs. per colony, on a range that previously produced from 75 to 150 lbs. of surplus per colony.

MANY APIARIES MOVED.

Over 40 carloads of bees were moved out of Southern California last spring to better forage in the alfalfa-fields on the eastern borders of the State—a new section for honey-production. I was informed that many places were overstocked with bees, and yet it saved many of our friends from great loss.

WEATHER REPORT.

We have reports of heavy rains and snow in

Northern Arizona, lasting a number of days. If this report is true, it will be followed by a wet winter here. We are having an unusual amount of cold cloudy weather for this time of year, and but little rain for some time. Nov. 22 we had about $\frac{1}{4}$ inch of rain, and now (Nov. 24) it is cold. Many are prophesying a wet winter and a banner honey year for 1909; but we can tell better when the honey is in the can. In this section, most bees are in good condition for the winter. I shall plan to have an abundance of young selected queens coming on in early spring near the coast, where the season is two months earlier than in the mountains or best sage ranges.

Ventura, Cal.

TRAVEL-STAIN.

The Cause and Remedy; a Special Honey-board Designed for Keeping the Surface of the Comb Honey Clean.

BY J. E. CRANE.

A few years ago I sent to GLEANINGS one or two articles on the subject of travel-stain. Several criticisms followed, in which the writers seemed to regard my views on the subject as rather wild or heterodox. I had something more to say on the subject, but delayed doing so until I had more fully studied the subject and made some experiments I had in mind. Indeed, I left unsaid the most important part—the prevention of the trouble.

As it has been several years since the subject

was discussed I might state briefly that the so-called travel-stain appears to be caused by, first, the bees covering themselves with pollen and entering their hives and rubbing their bodies against the combs and sides of the hives, causing a slight and sometimes considerable discoloration of the combs. I mention this, first, not because it is the most important, for it is not, with me at least. Second, the use of old wax, bits of propolis, the cappings from hatching brood, and even bits of cloth, or any thing that comes handy, mixed with new wax in various proportions for capping the new comb in sections, and so greatly injuring its appearance.

This has been a serious trouble with me, and is rather increasing as time goes on, especially in poor years. I shall not at this time try to prove that my conclusions are correct as to the cause, for I believe that any one who has given the subject careful study will agree with me. It will be my object, rather, to show what may be done to correct the trouble and overcome it, as those who were so much wiser than myself as to the cause of this trouble have given us no clue as to how it may be remedied.

As a good physician finds it necessary with every case that comes to him to make a careful and accurate diagnosis of the case before he writes his prescription, or outlines a method of treatment, so we, as bee-keepers, should very fully understand the difficulties with which we have to contend before we can hope to overcome them.

If we sit down to a bench and clean sections hour after hour we shall not be long in observing that such supers as have combs stained have the most stain near the center; or, to put it in another way, that the worst-stained combs are, as a rule, in the center, while those least colored are at the sides.

We shall also observe, if we look carefully, that the central combs of the brood-chamber are

E. W. ALEXANDER IN HIS LAST DAYS; THIS PHOTOGRAPH WAS TAKEN ON THE LAST OF AUGUST.

CRANE'S HONEY-BOARD AS USED BETWEEN THE BROOD-CHAMBER AND SUPER.

darker than those on the outside. Indeed, it often happens that, if the combs of a hive have not been changed during the honey season, the outside combs may be quite white. Combs built outside a division-board are often of snowy whiteness. In the same way it occurred to me that there was some connection between the darker combs of the brood-chamber, where the largest part of the brood was reared, and the stained combs in the center of the super above. How could I manage so as to allow the bees to pass up any dark wax or cappings of hatching brood just below?

I noticed another thing: The further the surplus combs were from the brood, the whiter they were. But it is an old maxim, that the nearer the surplus boxes are to the brood the sooner and more rapidly are they likely to be filled. I was in a dilemma; for if I made it difficult for the bees to get into the supers and carry up dark wax they were likely to store a good deal less honey. It seemed to be a case of less stain, less honey, or more honey, more stain. I could have my choice.

At last I made some honey-boards, something

A FLOCK OF WHITE LEGHORNS OCCUPIED THIS TENT ALL WINTER AT THE STATE AGRICULTURAL COLLEGE GROUNDS, STORRS, CONN.—SEE POULTRY DEPARTMENT ON ANOTHER PAGE.

I had not used for many years. I send a drawing of one of them. It is made of $\frac{1}{4}$ -inch stuff except the strips around the outside, which are $\frac{1}{2}$ inch thick, so as to give a bee-space of $\frac{1}{4}$ inch between the bottom of the super and the top of the honey-board. On each side is a half-inch opening leading from the brood-chamber up into the bee-space below the super. This opening into the brood-chamber is where the combs are the lightest or least stained. The middle part of the board is what I call "the storm-center" of the travel-stain, both in brood-chamber and super.

After studying the subject carefully I came to the conclusion that such a board offered the best solution for checking the carrying-up of soiled wax from below into the super. I made quite a lot of them for trial the following season; yet so fearful was I that it would reduce the amount of honey in the supers that I used but few of them the following season; but the few I used surprised me in that the bees seemed to store just as much

honey in the super as when they were not used.

I was not surprised as to the effect the use of this board had on decreasing the stain on the combs in the super. Those sections occupying the center, instead of being the most stained were the least so, while those on the outside, while somewhat stained, were not so bad by a long way as those in the center had been without the use of a board.

I was so well pleased that later I made boards to cover most of my hives. Later experience with them has been very satisfactory. During the past season I have used them on a large portion of my hives run for comb honey. I found an occasional hive that did not appear to have finished off its combs as well as though no board had been used. It is not necessary to put the board on until the bees are

ready to cap the honey in the super, and not even then if the first super is raised up and an empty one placed under it. When they finally begin

CRANE'S HONEY-BOARD TO PREVENT TRAVEL-STAINED SECTIONS.

sealing they seem to work in the supers as well with the honey-board on as off—at least most of them do—and the improved appearance of the surplus honey well repays the trouble of using the boards.

My brood-combs are mostly old, and, of course, pretty dark, and the top-bars are thin and narrow. I think that, with thicker and wider top-bars, whiter surplus could be produced; but this may be only a fancy.

Another method of protecting surplus honey is to use, as far as possible, new combs in the brood-chamber, taking away the old combs about the time the bees begin to seal the section honey, replacing them with new white combs or foundation, or even allowing them to build new combs in the brood-chamber. If one has a surplus of old combs on hand that he desires to use he can place four of them in the center and two combs of foundation on each side with a honey-board, as above described, between the brood-chamber and super. The object is to keep old dark combs, as far as possible, from the super honey.

It is desirable to keep every thing about the hive as clean and free from propolis as possible. It is my present intention to remove slowly or exchange my old brood-combs for new ones, saving the best of the old for extracting purposes, and then melt the rest into wax. I can get from three to four pounds of wax from eight old Langstroth brood-combs; and since it requires but little more than one pound of foundation to fill them, there will be but small loss in making the change.

By the above methods I find the evil of travel-stain can be in a large measure remedied, and we have the satisfaction of having combs very much whiter than I had formerly supposed possible.

Middlebury, Vt.

SWARM-CATCHERS.

The Advantage of Light Strong Cages which can be Quickly Placed over the Front of a Hive as the Swarm is Issuing.

BY C. W. DAYTON.

I have never seen the need of a long pole for a swarm-catcher, and it was long ago when I began to use the kind which I am about to describe. It is convenient, as we are passing to and fro, busy at other work, when we see a big swarm beginning to issue, to pick up a light cage and clap it over the front of the hive. It saves their mixing with other swarms which may be already out, and prevents their going into high trees or drifting into the yard of some pettish neighbor. This cage that I use has wire cloth upon five sides, while the other side is open. The open side fits so closely against the hive that no bees can get out. The bees will cluster rather compactly in the course of an hour. After that the catcher can be handled in almost any way. If I am not ready to hive the bees I put the catcher containing the swarm into a sack, and hang it up on the shady side of a building, or the bees can be shaken out into any confining box.

The illustration shows the front of one of my hives and the $\frac{3}{8}$ -inch auger-hole entrances which

I have used nearly exclusively for about 20 years. I have an arrangement to enable the bees to climb up to these entrances, but it is out of the scope of this article to describe it. The three small holes prevent the swarm from issuing as rapidly as it would if an ordinary hive-entrance were used. More ventilation is necessary, but it is secured in another way rather than at the entrance.

At *a*, *a*, in Fig. 1 and 3 are the furniture tacks which are driven into the hives to hold the swarm-catcher. This swarm-catcher is made entirely of galvanized iron and wire cloth. The dark shaded part of the catcher shows about the usual appearance of a swarm when clustered in it.

The side rails of the catcher are made of $2\frac{1}{2}$ -inch strips of galvanized iron of 28 gauge bent into V shape and firmly soldered to corner caps as indicated. It does not take very much time to bend enough for 5 or 10 of these swarm-catchers in case there is no tin-shop handy by.

If the bees of a swarm are kept in this screen until near night they can be hived without any of the trouble and anxiety about queens, or about the disposition of the swarm to stay hived. We always know that the bees will stay until morning, and then if they have gone inside the hive and taken possession and appear contented, it can be seen at a glance. If they are dissatisfied they usually remain partly outside all night, and do not cluster among the combs or hang on the empty frames. They act shy of every thing we furnish. When the bees act willful—that is, when they remain in close cluster and do not start to the fields to work in the morning—it is best to keep them confined for two or three days. After we furnish a colony a good hive, and stores to live on all winter, and spend our time, labor, and patience to get them built up to good working strength, and then have a great lot of old bees pull up stakes and hike away to the woods, they ought to be “put in chains.” Besides swarm-catchers I have about 20 boxes of simple and cheap design into which I can shake bees. It is no use to put the bees in a hive until they are in want of it. They will realize the need of one sooner if they are clustered without hive or combs. The object of the catcher is quick adjustment. When we see a swarm beginning to issue we need to get there quickly. I usually set my extracting-house or work-shop as much among the hives as possible, and the hives facing toward it as much as possible. Instead of using one or two small screened windows I have a 24-inch screen extend-

ing entirely around the building. I set the extractor and capping-cans so that the operator faces the hives so that his eyes can glance out across the bee-yard. A woman or even a child can manage the swarms from 200 or 300 colonies if they have a good equipment of catchers; and they can sit in the shade and sew or read most of the time, no matter how fast the swarms come out. There will be no mixing. In some large apiaries it is often that a small-sized swarm may issue, and by the time it clusters it will be the size of a bushel basket. It happens more often in California than it did in the East, unless the East has changed since I lived there. It is because the flying bees coming from the fields join the swarm. It makes trouble with the queens when these strange bees "mix in," and perhaps a very valuable queen is lost. It injures a queen to be balled or attacked.

I have 150 drone or queen traps, and have used them several years to control swarming, but I consider them a hindrance to the bees. If I wish to leave home for a day or two I go through the apiary early in the morning, and put traps on those colonies which are roaring loudest. If the entrances are large there will be no roaring. My traps are arranged so as to hook on nearly the same as this swarm-catcher. It takes only a few moments to arrange a hundred colonies so that we can safely leave the apiary. I have kept from fifteen to forty colonies for four or five years having no bottom-boards at all, and those colonies on the average have swarmed first and as frequently as any of the other colonies.

Chatsworth, Cal.

BEE-KEEPING A FASCINATING PURSUIT.

An Enthusiastic Report of a Beginner's Experience; a Good Earning on the Original Investment.

BY CHARLES STEWART.

I am only a recent recruit in the lowest ranks of the army of bee-keepers; but if I could say any thing that would induce even one other recruit to engage in bee-keeping I should be amply repaid, and feel, too, that I had conferred a great favor on said recruit. Of all rural industries (and I have had more or less experience in many) bee-keeping is the most fascinating; and, if properly conducted with suitable fixtures, the money profit will average fairly with any other, to say nothing of the pleasure derived from the study of the faithful little pets. I am only a private, and almost any one having a fancy for bees can engage in their keeping to even a greater extent than I have, without interfering with other cares.

I bought two colonies to start with, and never have owned above 23. In the late fall or early winter I subscribed for your paper. That proved to be the virus that inoculated me with the microbe of bee-keeping. The long winter evenings, and access to a library well stocked with bee literature, was favorable to the "culture," and by spring I knew theoretically as much about

bee-keeping as the Moses who had been in the wilderness forty years with the bees.

I bought my first two colonies from a neighbor who had some surplus colonies for sale. He was one of God's own noblemen, and I am led to believe there are many such in the bee-keeping fraternity—not alone a sayer but a "doer of the word"—one of those whose religion it is to do more than bargained. After having sold me the two colonies at a moderate price he said: "There's a little weak colony; if you have a mind to fuss with it, take it along for nothing; but I judge it will need feeding to pull through."

I took it along. This was in March, after a winter of entrancing study of all phases of bee literature. I then had two moderately strong colonies and a nucleus—so to speak—of common black bees—all in boxes such as may be picked up in the back yard of a grocery store.

The first problem for the would-be bee-keeper that comes up for solution is the choice of a hive; and, in my opinion, it is an essential one. If a mistake is made here it is attended with serious consequences, as a change is not made without much loss, both in time and money. It is a problem that each should solve for himself only after mature deliberation. I selected the Danzenbaker hive, and I am vain enough to state freely that the choice was a good one. I winter outdoors on the summer stands and have never lost a colony, although severe winter weather is the rule, with temperature frequently 20 to 25° below zero; so I think I have no necessity for chaff-packed or air-spaced hives. Neither do I feel the necessity for a non-swarmers hive. My bees never yet have swarmed, so that, for me, the Danzenbaker has proved to be a non-swarming hive.

After the hive problem is solved, the next question likely to come up, but not so important as the hive, is the strain of bees to keep. For myself I settled this question by choosing leather-colored or red-clover Italians.

I brought my boxes of bees home March 18, covered them all snugly with tarred paper and let them stand till fruit-trees came in bloom, and then transferred to the Danzenbaker hives. The nucleus was a mere handful of bees, with a nice young queen, which, with some care, I built up into two rousing strong colonies, and later sold them for just \$50 more than my initial outlay. The two moderately strong colonies I ran for surplus comb honey. They gave me 256 finished sections 4×5×1 $\frac{3}{8}$), some of which I sold for 20 cts. each, some 18, 15, and a few of the least perfect and darkest as low as 10 cts. Of course, I did not sell it nearly all. Ourselves and nearest neighbors ate a fair share; but if all had been sold at the lowest price it would have netted \$25.60 on a net investment of *nothing*—yes, 50 cents less than nothing. Many do better than this. I have done better myself since; but the money returns to an amateur bee-keeper, while a source of some satisfaction, are not the only satisfaction. Without any monetary reward the pleasure derived from a study of the energetic little pets is itself a reward as pleasing as the opening scenes of life. It is like the entering of an unexplored paradise. Any person not already a bee-keeper, who wants to add new zest to life, should keep bees.

Toledo, Ohio.

UNCAPPING-KNIVES.

Hot Knives Needed for Cold Thick Honey.

BY R. C. AIKIN.

I have just read Mr. Robinson's article, page 1374. He refers to the use of water and hot knives as foolishness, and he hits me, for I use just that sort of plan. A shallow pan hangs on the edge of the uncapping-box, with a large lamp or small oil-stove under it to supply the heat; and as fast as a knife gets cold it is dropped into the pan and another one picked up. It is true that some honey gets into the water, and by and by it becomes a syrup and goes into the vinegar-barrel, and fresh water is substituted.

Mr. Robinson refers to having sour honey. Almost any kind of knife would do to slice cappings from honey that is so thin and watery that it will sour, and in a hot country like Texas.

Here I can take honey right from the hives in July or August, and uncap it very nicely with a cold knife, but with a hot one it goes a whole lot slicker. I can also heat honey in a house, and when warmed, and the room kept at about 90 degrees, it may be uncapped fairly well with a cold knife, but much better with a hot one. And, what is more, when I come across a comb of slowly gathered well-ripened honey, even when just from the hive, it is difficult to cut it with a cold knife; and sometimes, if the comb is new, it will tear. It is a whole lot easier on one's wrist and shoulder to have a knife so it will slip through easily, and that is what the hot one does.

The argument that the edge of a knife is so thin that it cools instantly when in contact with the cold honey, thus frustrating the desired end, is in part fallacious; but, even if true, the body of the knife is yet hot, and the cappings and the honey glide off, allowing a free and easy passage through.

But, Mr. Editor, there is not much to argue about. If the weather is hot, and the honey naturally thin and easy to cut, nothing is gained by heating—just use the knife cold. If the honey is a little cold, or inclined to be thick and gummy, the kind that puts a smile all over that face of Chalon Fowls when he gets a smack of it, then by all means use a hot knife, and save time and the shoulder and wrist ache.

EXTRACTORS.

Mr. Robinson speaks of not getting more than two-thirds of the honey out after frost. That statement needs qualifying to be clear. My first extractor was a home-made one for two combs of Langstroth size. I also used a Stanley reversible a very little. Then I used a little two-frame Root, non-reversible—one of those old-timers with a little horizontal crank on top so that one could speed it till it fairly sailed around. Since then I have used a four-frame reversible, made to order by the Root Co., the can a little bit larger than the standard four-frame, because I wished it to take in the American frame. Now for results.

The pockets of my home-made machine were hung close to the center-shaft, and I think it was geared at least three to one. It was burned up, so I am guessing at the gear, but it jerked the

honey out. So also does that little old two-frame Root machine, the pockets of which are also close to the center shaft, and the short crank set horizontally makes the basket spin at from 200 to 400 revolutions per minute. It is a high gear. My big four-frame reversible is geared two to one,* and has a rather long overhand crank. It is not effective except when the honey is quite warm, and it has to be cranked fast even then.

AN IMPROVEMENT IN EXTRACTORS SUGGESTED.

Over a big iron can and cast-iron cross-beam the gears make more noise than a railroad train, and in the house they make altogether *too much* noise. Can not those gears be made of hard wood or gutta-percha, or something less noisy? Possibly a wooden cross-arm would help to deaden the noise. I would suggest that the ratio of the gears be made greater so as to make a higher speed possible.

Loveland, Col.

[Experiments are being made with a special alloy for gears, with a view to reducing the noise, and at the same time insure a smoother running.—Ed.]

STRAIGHT KNIFE PREFERRED.

Yes, by all odds the straight knife, even a 16-inch butcher-knife, is far ahead of the short crooked-shank knife, as there is no side strain on the hand, and a long sawing motion does far better work. The point should be crooked a little, or else a short curved knife be used for depressions. A short bevel on the under side of the knife is an improvement, as there is less friction.

Mechanic Falls, Me. E. P. CHURCHILL.

I always use a sharp cold knife for uncapping. I have never tried a hot knife.

HEADS OF GRAIN

FROM DIFFERENT FIELDS

BROOD DIES BECAUSE OF A LACK OF VITALITY ON THE PART OF THE QUEEN.

On page 1327 I notice that C. B. Fritts, of Niles, Mich., has had trouble with brood dying in a half-grown stage. We have been bothered in the past by the same trouble, and at times we find it in the darker bees. We feel very sure that a weakness in the queen is the cause, and a lack of proper vitality will show itself when the larva is about half grown—by death. We experimented variously along this line till we found a remedy, and then concluded we knew the cause. We removed all brood, put the queen on foundation, and fed sugar syrup. This reduced the death-rate somewhat, but did not cure all. Some hives would get over the trouble as the summer went on, but others would still hold on to the malady.

One thing we noticed which made us feel that a lack of vitality was the cause, was that, as the hives were filled up with syrup, the trouble

* All four-frame extractors are now geared three to one.—Ed.

abated largely, and in some cases disappeared. We concluded that the trouble lay largely in the queens, and so went to killing the old queens and introducing yellow ones. This has in every case helped us out after the larvæ from the former queen were out of the cells.

Another point right here: The black bees with the least honey in the spring were the first to succumb to this dwindling of brood. Since then we have introduced the pollen-basket in the spring and fed eight stocks with syrup. The water-trough was also installed with a little salt added, and kept running the whole summer. Since then we have not been bothered as before. In fact, we do not expect this any more with yellow queens, early feeding, and watering in the spring; and we have long concluded that the trouble was due to a lack of vitality in the queen, either from weakened constitution or a lack of proper feeding in the spring. D. J. BLOCHER.

Pearl City, Ill.

DROUTH DOES NOT HURT CLOVER; SPRING FROSTS DO MUCH DAMAGE.

Don't worry about the drouth, p. 1365. That hard-headed farmer is right. Here on the Manitoulin we had drouth. The soil is about four inches deep over limestone rock. It was wet in July, and not again until near the end of September, when we had another nice rain, followed by another about the end of October. Through all this dry weather clover was always green. Last year when the drouth was so severe that the ground had the appearance of being burned over, clover sprang up under a scorching sun before rain came. It is the spring frost heaving it out that we most dread.

By the way, will next season be wet or dry? I have often noticed a dry summer being followed by a light fall of snow the next winter, and a dry fall giving a dry spring. What have others seen? Little Current, Ont. W. MOORE.

A DENTED QUEEN OF NO VALUE.

Last June I bought a select tested queen. In May I raised a queen from her queen-cells over the same colony, which hatched out May 29, 1908. To-day, July 5, there is no sign of brood, and the few eggs that may be found do not hatch. The queen has a dent at the end of her abdomen on the upper side. Sometimes she lays two or three eggs in one cell. The bees are queenless, but she is there just the same. Two queen-cells, which I overlooked, are still there, but there are no eggs in them. HARRY LEBNER.

Chicago, July 5.

[Very often, and generally, a dent in the side of a queen will do no harm; but in this case it is clearly evident it ruined her. All such queens should be replaced without delay.—Ed.]

DOES PAPER OVER HIVES PREVENT MOISTURE FROM ESCAPING?

I winter my colonies in hives placed close together in a box 8 feet 4 inches long, made of half-inch shoe-box lumber. There is room for five inches of packing in front and rear, and the same on each end. Now, I propose to put building-paper around the row of hives, folding it over the

top, and then laying newspapers over that. I would then add the packing material as before mentioned. Will the paper on top hold the moisture in the hive enough to make its use objectionable? There would be six inches of packing over the paper. J. H. SPROT.

Gosport, N. Y.

[There should be a cover which the bees have sealed down before the paper is put around the hive.—Ed.]

FREEZING WEATHER IN SPRING HURTS CLOVER MORE THAN DROUTH IN FALL.

Your farmer friend was right as to the clovers. Here, as in the section you mentioned, the clovers are about the only green plant-life to be seen. If there is plenty of snow this winter, and not too much freezing and thawing in the spring, there will be no need of worrying about the clovers. The early part of spring, when there is much freezing and thawing, is the trying time on clover. Three weeks of this kind of weather will do more harm to the clover than three months of severe drouth. THOS. H. WHITE.

Connersville, Ind., Nov. 30.

BEEES IN CHINA.

I do not know whether many bees are kept in China or not; but Mr. Wilder (Rev. George D. Wilder, missionary) has quite a number of hives; and the last time I was out there he got a stray swarm—a larger one than I had ever seen or heard of. The bees of China are, it seems to me, a little longer-bodied, and a little yellower than the Italians, and they are even more quiet and peaceful than they. Mr. Wilder goes among his and handles them bareheaded, and when I say bareheaded I mean *bare*, for, like old Uncle Ned,

He has no hair on the top of his head—
The place where the hair ought to grow.

And he never gets stung. They have honey as they want it, and very nice honey too. Peking, China. D. I. MINER.

[The above extract from a letter was sent us by one of our subscribers.—Ed.]

CONDITIONS IN A DAMP TROPICAL CLIMATE.

In this climate, for the past three months the thermometer has stood between 85 and 95 in the shade, with heavy rain nearly every day; every thing is damp. The paper on which I write I have to dry over a fire to prevent the ink running; dry clothes are simply impossible, and even one's boots get a blue mold on them in a single night. This will give some slight idea of the climate in this locality. The bees carry in quantities of pollen from maize, pumpkins, etc., but very little honey. The heavy rains wash the nectar out of the flowers. If any of your tropical correspondents living in the low lands would kindly mention their treatment of bees I should be very thankful. FRANK W. BREACH.

Chinipas, Chihuahua, Mexico

[This is in strong contrast with the weather we have been having in the United States, especially in this section. But nature has already begun to equalize, for we are getting heavy snows.—Ed.]

BEUHNE PLAN OF INTRODUCING; A GREETING FROM AUSTRALIA.

Among the numerous methods of introducing queens given in GLEANINGS I have never seen that originated by Mr. Beuhne, and illustrated some years ago in *The Australian Bee Bulletin*. He discovered, I believe, that, if strange bees were admitted into a queen-cage after all the attendants had been removed, they would not molest the imprisoned queen. Consequently a cage was constructed by him with a side opening covered with queen-excluding zinc through which the workers had access and became familiar with the new queen. They then assisted from the inside the workers on the outside of the cage in eating the way out for her through the candy.

Since this appeared I have always altered the Benton cage by making a side opening, covering it with a piece of queen-excluding zinc and thus introducing the queen after liberating her attendants. In my experience this method has never failed.

Mr. Beuhne's cage can also be used as a nursery cage by making a hole at one end sufficiently large to admit a ripe queen-cell.

Your subscribers will be grateful for that fine photo of our dear old friend (for such I esteem him) Dr. Miller. My regret is that you printed on the back of it, and so prevented its being framed without mutilating the number in which it appeared. The first portion of each successive number of GLEANINGS that I read is that under the head of Stray Straws. The pithy, humorous, and good-natured comments are always admirable, more particularly when the writer is having a "sly dig" at a certain well-known editor. I am pleased to be able to add my small quota of appreciation to the fine character of the dear old doctor.

Will you please give the botanical name of mammoth clover, page 931? It would aid considerably if this were always done when mentioning useful plants.

I have not written with a view to your publishing my letter, but more as an expression of good will from Australia to our brethren in the United States.

From a Victorian brother who sends hearty fraternal greetings. EDWIN COX.

Northwood, Victoria, Aus., Sept. 25.

[This plan of putting perforated zinc on introducing-cages for the purpose stated has been before given in these columns; but whether the idea at the time was copied from, friend Beuhne, we can not say.

It generally works well; but in the case of some cross or obstreperous colony the bees will sometimes attack the queen.

Mammoth clover is a variety of *Trifolium pratense*.

We certainly appreciate your hearty greetings.—ED.]

WERE THE BEES DISEASED?

On page 1327, Nov. 1, C. B. Fritts wonders whether honey from poisonous plants killed the brood. Two years ago I was having about the same trouble, and I sent samples of brood to Dr. G. F. White, of Washington, D. C. He report-

ed it to be what was commonly called black brood. The disease started near Dowagiac, Mich., some four or five years ago, and spread very rapidly in all directions and wiped out several small apiaries that were not treated. My apiary of 42 colonies was reduced to 11 colonies, and I got no surplus two years ago. A year ago I re-combed all colonies, increasing them to 22. This last season I treated 5 colonies, and increased to 46 colonies, getting about 1500 lbs. of comb honey. I introduced Italian blood and pinched the black queens, and, so far as my yard is concerned, I am free from the disease. I have the best success with the Baldrige method of treatment. I am located east of Dowagiac where the disease started. As Mr. Fritts is west, I think it is possible that he has black brood in his apiary also. W. C. TAYLOR.

Decatur, Mich., Dec. 14.

[We know of no honey that kills brood. If brood dies it is due to starvation, cold, heat, or disease. All suspicious cases should be examined carefully, and if in doubt, it should be submitted to an expert.—ED.]

QUERY AS TO INBREEDING OF BEES.

I desire to improve my bee stock both for honey-gathering qualities and color, and I wish to know the results of inbreeding to attain these qualifications. What I want is the experience of any one on the subject. I desire to produce a great honey-gathering strain of bees, queens of great laying powers, and at the same time improve the color in the direction of the goldens, but I don't want the golden bees. Furthermore I want gentleness in the bargain. Let us hear from the men who have had long experience along this line. T. P. ROBINSON.

Bartlett, Tex., Dec. 1

[Inbreeding, when intelligently practiced, is all right; indeed, by it our best breeds of cattle and horses are produced. When applied to bees we run up against the difficulty of controlling the selection of the drones.—ED.]

SUPERS ON HIVES THROUGH THE WINTER.

Is it a good plan to leave supers on hives through the winter partly filled with honey or empty combs? M. R. REEVES.

Grenola, Kansas.

[The plan is all right so far as giving stores and wintering is concerned; but we would not advise it, for the reason that the sections and supers will be more or less soiled or travel-stained. Better give the stores in the form of brood-combs.—ED.]

A CORRECTION.

On page 1372, Nov. 15, I am made to say that the eight-frame hive needs less care than the ten-frame hive. What I meant to say was that the eight-frame-size hive needs more constant care than the ten-frame hive. E. D. TOWNSEND.

Remus, Mich., Nov. 30.

OUR HOMES

By A. I. Root

And God said, Let us make man in our own image, after our likeness.—GEN. 1: 26.

How beautiful upon the mountains are the feet of him that bringeth good tidings, that publisheth peace; that bringeth good tidings of good, that publisheth salvation; that saith unto Zion, Thy God reigneth!—ISA. 52: 7.

I want to talk to you this morning about feet—yes, beautiful feet; and I hope and pray that my talk may be helpful. One Sunday morning at that Bingham Sunday-school I told you about, in the hills of Northern Michigan, I asked the children, "How many of you would like to have beautiful hands? Please raise your hands, every one of you who would like to know how to make your hands beautiful."

There was quite a little smiling, especially among the girls, but I think most of the hands went up, and then I added, "The recipe for making your hands beautiful I have just read in the *Sunday School Times*. Now listen while I repeat it, for I want you to say it after me:

"Beautiful hands are those that do
Things that are useful, good, and true."

And then I had them repeat it after me again and again; and I have often thought of it since that time. Just this morning it occurred to me that if I could talk with that Sunday-school up there once more I would vary the couplet and put it this way:

"Beautiful feet are those that do
Errands that are useful, good, and true."

Yesterday Dr. Creggan, a great missionary who has been around the world one or more times visiting different missionary stations all over the face of the earth, told us in his address that the whole wide world might rejoice at the *emancipation* of China. There are in China, as you may know, something like 400,000,000 people, while the whole United States can scarcely scrape up 80,000,000 all together. Well, China has been noted for her exclusiveness and superstition. A part of her foolish, silly, and horrible superstition has been, for more than a thousand years past, that women's feet should be small. You have all heard about it. The women of caste and fashion, at least, have their feet cramped from childhood, so that they are literally crippled—horribly crippled—so that some of them, at least, can not walk at all, and millions of them have been thus crippled during the last thousand years. We can scarcely contemplate or believe that it is possible, just because of the silly fashion, that the greater part of the world have been more or less *helpless* cripples; and it is the poor weak helpless women who have been, and are even now, crippled in that way. The boys and men can run and jump, and enjoy the use of their limbs; but the girls, at least after a certain age, are "crippled for life." There is no help for the older ones. All the doctors and all the treatment and all the asylums can never make their feet outgrow the consequences of this hideous mutilation. But the coming generation, thank God, are going to be delivered from this thralldom and cruelty. An edict has just been issued, if I am not mistaken, about it, not only permitting the girls and women of China

to let their feet grow naturally, but *forbidding* them any longer from warping and imprisoning the toes that God made to be of service.

There is another emancipation for which we can thank God, and that is, that opium is also to be forbidden and debarred; and it is not "poor heathen China" that is so much to blame for the opium habit. The great British nation, first in civilization, or claims to be, has been forcing China to take up and keep up this horrid traffic. How is it possible that the world has lived so long and these things I have just mentioned have been permitted to go on unrebuked?

Well, the people of the United States need not congratulate themselves on being *so much* ahead of the rest of the world when they are obliged to confess that, until the present time, the awful liquor-traffic has been permitted to go on almost unmolested; yes, and even now there are people right around among us who claim we "can not pay our taxes" unless the saloon-keepers be permitted to make cripples and idiots of our innocent children almost *before* they are born.

Let us go back to the feet, the beautiful feet—the kind that "bring good tidings, that publish salvation, that say unto Zion, Thy God reigneth." While that great missionary was telling us about the crippled feet of the poor Chinese women, my mind instantly reverted to a fact that I have long been considering a protest against—the continuous crippling to a greater or less extent of the feet of the good people here in our own land, and especially the feet of the women folks. The toothpick-pointed shoe has largely gone out of fashion, yet I see some of them even yet; and I see that the tyrant Fashion inflicts upon us, and demands that we *shall* wear some that are not very much better. What brought this to my mind a few days ago was getting my eye on an advertisement in the *Ladies Home Journal*. I like to look over the advertisements in any periodical. In fact, I often judge of the character and literary standing of a periodical more by the advertising than by any thing else. Well, I saw a picture that almost made me shout, "May the Lord be praised!" Here is the picture.

THE COWARD SHOE.

The Coward "Good-sense shoe" provides room for five active toes. Its pliant sole furnishes a natural foot-tread—a perfect-fitting shoe that supports ankle and arch, and prevents flat-foot. Economical in price and wear. For children, women, and men. Send for catalog. Mail orders filled. Sold nowhere else.

Address

JAMES S. COWARD,
268—274 Greenwich Street,
New York.

Well, what do you think of it? The man who has had the hardihood and courage to come out thus in a great journal and recommend a shoe that will let the feet grow and live (as God meant they should grow and live) this man is named *Coward*. Well, it is queer how our names sometimes fit us. Instead of being a coward he is a great warrior, and I should like to see him have a following—well, I would not stop at trifles, but I should like to see him have a following of 400,000,000 or more. Of course, I can not see

it before I die; but may God grant, when the time shall come, that *all* the boys and girls on the face of the earth, and *men* and *women*, shall adopt some sort of footwear that will let their feet grow as naturally as their hands and their fingers grow.

When I thought of taking up this subject I made up my mind that I would ask a great lot of people to let me take a look at their bare feet. As I have reason to believe that womenkind are the greatest sufferers I mentally decided that I would go to every one of my daughters—yes, and granddaughters—and ask them to take off their shoes and stockings, and let me see their feet. Yes, and I decided to go to my sister, too, and to some other women where I felt sufficiently well acquainted, and tell them I wanted to take a look at their bare feet.* Do you know why I did not do it? It was because I knew from past experience that I could not and must not put an account of it in these Home papers. Dear friends, I have written at least one Home paper that was ruled out by my sons and daughters, and by Mrs. Root. While they admitted it was a subject that was sadly in need of a tremendous reform, they decided it belonged rather to the province of a medical journal than in my department of GLEANINGS. I still think it ought to have been allowed to appear; but I hope I shall never get to be so contrary and stubborn, even in my old age, that I can not listen and give way to the advice and counsel of the younger ones.† I wonder how many of our women readers would be willing to wear or at least go out in public with a shoe shaped like the one in the picture. I have suggested the same thing in years past, but I have been met right and left with the reply that it would never do to adopt any thing so entirely out of fashion. Good women—yes, some among the great reformers—say that one who goes out in public must conform, at least to *some* extent, to the prevailing fashions, no matter how ridiculous or hideous the fashion may be. A few years ago women were killing themselves by tight lacing, and for a time the doctors' protests and warnings seemed to be of but little avail. But a reform has come—yes, a great reform—even though there are still a few who go about with wasplike

waists. When some of these friends of mine with their painfully small waists argued that it was their natural size, and that they were not cramped at all, I replied, "Then for God's sake wrap something around you and make *believe* you are like other people, even if God did not make you that way." I think T. B. Terry's teachings have done much to encourage the use of loose clothing. And, by the way, T. B. Terry, I want you to help me in this crusade for natural feet. Yes, I want every minister of the gospel to help; and I know the good honest physicians and family doctors will help, and will tell you that I am right.

Now, I have not made the examination I have talked about so as to prove what I say; but I want to ask every father and mother, whose eyes are on these pages, to take particular notice just now of the cramped and deformed feet belonging to your wives and daughters. If there is not any thing of the kind to be *seen* among barefooted women, then the world is better off than I supposed. Let me give you a little of my experience.

In my boyhood I went barefoot just as long as custom would permit, and I have gone barefoot a good deal of my life when circumstances permitted. I greatly enjoy, even now, wading through the grass in the morning before I put on my shoes.* Several times in my life I have tried to conform to fashion; but *my* toes made such a protest that I wore my Sunday shoes only when I had to go among people. If you will look at the picture I have given you, or look at a child's foot, especially that of a child going barefoot, or a baby's foot, you will get a glimpse of the way God made our feet. Do you say the natural foot is not beautiful in an artistic sense? Well, just take a look at a baby's foot before it has been cramped out of shape by fashionable shoes. Did you ever see any thing prettier than those pink toes, the graceful curves, the arched instep, and the rounded heel? Well, this baby's foot, and, in fact, every other natural foot, is somewhat three-cornered—the heel at one corner, the big toe at another, and the little toe is the third corner. Well, in the attempt to make my left foot conform to fashion I cramped it in the corner just back of the little toe until a serious corn or chilblain, or the two combined, set in. I finally went to our family physician about it. Said I, "Doctor, I do not know whether you want to undertake to take care of the feet or a sore toe; but I should like your advice, any way."

He replied, "Mr. Root, I am always glad to do *any* thing to alleviate human suffering. My business in life is that, and I enjoy it."

After he looked at my foot he told me I would have to get an old boot or shoe, and cut out a piece of the leather clear around that sore spot; and I would have to go around that way for three or four weeks; for unless I did, something serious might happen. He said it was owing to a lack of ventilation in my shoe. Then he went with

* When I first thought of taking up this subject, and was discussing it with my wife, she positively forbade my saying any thing about *her* feet. But I am going to add this much:

Mrs. Root, even when a girl, was remarkably active, and full of life. She could run and jump, and even climb trees; and even now, when she is pretty close on to threescore and ten, when she is in a hurry with her work she can skip about almost as quickly as any of her children or grandchildren. When our good friend O. O. Poppleton was here a few days ago he said something like this: "Brother Root, it is really remarkable to see a woman as well along in years as your wife fly about in the way she does when she wants to accomplish a good many things quickly."

Brother Poppleton was right about it. And now just contemplate, if you choose, torturing and maiming such a bright good woman by *obliging* her to conform to fashion! I have seen her come up the doorsteps with a look of pain on her dear face that fairly touched my heart as she hurried to the cupboard near her bed and jerked off her fashionable shoes and replaced them with the easy cloth ones that she wears about in her every-day work. There, I have told my story, but I have not said a word about her feet, after all, have I? I think I told you some time ago that, when I was courting Mrs. Root, I "loved the very ground she trod on;" and I now say, as I come down to old age, I do not reverence that same "ground" a bit less.

† Perhaps I should add right here that, since that paper of mine was thrown out (the subject was the need of better toilet rooms or closets for the home), there has been a wonderful reform—one almost worldwide. It seems to me I was a little ahead of the times—that is all.

* So far I have not said any thing about caring for the feet so as to keep them natural and healthy. Wading in the dewy grass is nature's cure, and perhaps the best thing in the world. In the winter time (when there is no grass) the feet should not only be bathed often, but soaked thoroughly so as to cleanse them from every thing that can be removed by the brush or towel. When the feet are disposed to get dry, hard, and painful, I have never found any thing better than a little vaseline. I suppose the various foot-powders so much advertised may be helpful for sweaty feet; but I have never found them by any means equal to the vaseline.

me to the shoestore and picked out a pair of low shoes that laced almost down to my toes. He said my feet demanded ventilation, and would have to have it. He said that many people are absolutely obliged to let their feet have air to breathe, as well as to let the mouth and lungs have pure air. I think I have mentioned before that Abraham Lincoln used to do his writing mostly in his stocking feet so as to give his feet a chance to "breathe." May God bless the memory of the great and good man who taught us so many useful lessons! Well, I even went to church with a hole in my shoe. I think I put some ink on my stocking so as to make it as near the color of the shoe as possible, and in a short time that foot got well; but I have worn loose shoes ever since. While building up that little Sunday-school early in the spring in Northern Michigan I did a great deal of traveling one Sunday morning. I canvassed the whole neighborhood, and secured a big Sunday-school that very first morning; but in so doing, with my Sunday shoes on, that particular corner of my left foot got to be so bad that, after the Sunday-school was over, I pulled off my new fashionable shoe and walked home with that foot bare. It still burned and pained me so that I purposely walked in a snowdrift beside the road; and I finally put that feverish, painful foot into snow and water and kept it there. The fever in that foot was so great that I kept it in cold water a great part of the afternoon; but after putting on my loose open shoes I had no more trouble during the week. That was Nature's protest against a horrible, unreasonable, fashionable shoe. I suspect there are more than one of you who have gone through a similar experience.

Just now I have in my possession a very *nice-looking* pair of patent-leather shoes. I got patent leather because one of my boys suggested that it would save me the fuss and bother of shining my shoes up every little while. Well, I have had them four or five years. I can wear them to church, and look like other folks; but I am always happy when I get home and can put on my old shoes that are out of fashion.

Now, to illustrate, suppose I am called on to address a Sunday-school, which is generally the time I take for my afternoon nap, just a little after dinner time also; then to add to the rest of it, those pinching shoes make me feel cross when I need the greatest spirituality.* Of course, I can shine up my old ungainly shoes, something like that in the picture, and stand up on the platform before the audience. Now, here is the problem: When we are called on to speak in public, we older ones, of course, do not need to be clear up in fashion in our attire; but we should look decent and reasonably respectable, especially if we wish to have our words have weight, and count; so I do not know but it is a Christian duty to conform, at least to a certain extent, to fashion; but the time has come, dear friends, when a great lot of us should band together and declare that we will no longer submit to the tyrant Fashion, especially when this tyrant violates

all rules of good sense and reason. Has the time not come when we should not only cheer and encourage the poor heathen Chinese, but go a little further and take the lesson home? Who is there among us who can not give three cheers for the man who has brought this new shoe, and even dares to advertise it in the *Ladies' Home Journal* — the man who is not a coward in any sense of the word, but who is a brave general to come out thus boldly and defy the demands of fashion? I do not remember now any thing about the price of his shoes; but I presume it is no more than is usually charged for other good shoes. It may cost a little to get them by express. But how much is it worth to you to have good healthy feet — feet that will enable you to enjoy life and to thank God, and, may be, walk *a mile further** each day than you would with the old-fashioned ridiculous kind? May God be praised that I still have the full use of my eyesight; that I have also the full use of both hands; and last, but not least, that I can run and jump, and go a mile almost as quickly and easily as any of my children or grandchildren; and may God speed the day when our greatest care, while we are permitted to be here on earth, will be to look after, study into, and take care of these bodies of ours that our opening text says were created in God's own image; and then may the great Father above help us to take care of the *feet* he has given us, including the toes, that we may preserve them, not only in the way of keeping them beautiful but useful, that we may, with their help, spread the "glad tidings" and "publish salvation," not only throughout China and Japan, but over this whole wide world, *including* the United States of America.

POULTRY DEPARTMENT

THE POULTRY-HOUSE TENT AT STORRS, CT.;
MORE ABOUT IT.

After my article on page 1273, Oct. 15, was printed, the editor of that beautiful and useful publication, *Suburban Life*, called my attention to the fact that in their issue for last May they gave a picture of the very tent that I was so much taken up with; and they have also kindly loaned me the cut so I can present it to our readers. See page 1508. Here is what they have to say about it:

There is much discussion nowadays among poultry-men in regard to poultry-houses which are open at one side, or which have windows without glass, even during the coldest weather; and a number of poultry-raisers are using this plan with success. For testing the practicability of the cold-air method, Professor Graham erected a tent made of ordinary duck, costing about six dollars. He placed a roost and nests in this tent, and made it the home of a small flock of White Leghorns — a variety of birds, as is well known, having unusually large combs. These birds have lived in this tent all through the past winter, and not one of them has had its comb even touched by frost, while the flock have laid fairly well. It is a fact, strange as it may seem, that the thermometer has shown the tent to be warmer than some of the regular boarded houses.

My impression is that, during zero weather, they were in the habit of banking up snow around

* Suppose, for instance, that we wish to impress on the school the beauty of the great promise of the little text as follows: "Thou wilt keep him in perfect peace whose mind is stayed on thee;" and suppose, too, while you are striving to add emphasis to the text, those shoes are pinching your corns until you are in any thing but a Christianlike frame of mind!

* "And whosoever shall compel thee to go a mile, go with him twain."

the tent in order to cut off drafts and cold winds. I notice that the chickens (like my poor self) can stand cold very well if there is not a breeze, or, worse still, a strong wind; therefore these cloth houses ought to be as nearly air-tight as possible, for plenty of air percolates slowly through the cloth at all times and under all circumstances. Have the opening made for access so it will shut up as nearly air-tight, or, rather, wind-tight, as possible. If an opening is left for the chickens to go out and in at pleasure, this too should be closed up absolutely tight during zero weather. Now, in order to prevent this opening admitting a draft of cold winds I would suggest having an underground tunnel, and I have already used such a device quite satisfactorily. To do this your tent should be on sloping ground, so no water can be by any possibility collect in their tunnel. Some years ago I had such a tunnel leading from the poultry-house to a string of cold-frames, and the fowls greatly enjoyed themselves in winter weather, scratching and dusting under the glass sashes. Now, please be sure, if you use glass at all, to give the chickens the privilege of running out from under the glass whenever it becomes too warm. If you do not do this, the overheating during the middle of the day, even in winter, may do the chickens positive harm. My impression is that cloth instead of glass would be much better for poultry the year round, and we should be sure that even the cloth tent does not get too warm inside when we have a spell of warm weather in winter.

In closing let me remark that, if you have not seen *Suburban Life*, you should at least get a sample copy. It is one of the most beautiful works of art that our nation or any other has ever submitted to the people. The pictures alone are worth its price—25 cents for a sample copy. For the address, see their advertisement in our last issue.

While on this subject a newspaper clipping was sent me by some friend, so I can not give credit to the paper from which it was taken. Here it is:

POULTRY-HOUSE IDEAS.

A poultry-house should not be built on the plan of a dwelling-house. It is impossible to retain the heat in the house by the exclusion of fresh air, and have the house dry, without the use of artificial heat. At the Maine experiment station it was found that hens confined in a cold or curtain-front house consumed 15 per cent more food than a like number kept in a warmed house when the temperature was just above freezing. It took four tons of coal to heat the warmed house, which cost considerably more than the extra feed. The egg yield in the two houses was about equal; but the eggs from the hens in the cold houses hatched by far the best.

It is very true that, under the circumstances mentioned, we had better give the chickens an extra amount of food rather than buy coal for fuel. But I feel sure that, if the cloth tent is properly fixed and managed, we can save a large part of the "fifteen per cent" and still get the same number of eggs and the best kind of fertile eggs.

"NOTHING TO DO BUT GATHER THE EGGS."

The above quotation is not exactly as it appears in Edgar Briggs' new book, "Profits in Poultry-keeping," but it comes pretty near it. What we do read is this: After having described the automatic feed-boxes, those that will contain enough to last the fowls a week or two, he says, "If your plant is built on a stream, and inclosed

with a good wire-netting fence, all the work you have to do during the week is to gather your eggs every night."

Whew! wouldn't that be a bonanza? "nothing to do but gather the eggs!" Of course, at the end of one or two weeks you would have to take a horse and haul around grain to replenish the hoppers; but if the hens really laid eggs enough to make a profit after paying for their feed, what a gold mine we should have! for when you get one pen in running order you could get right at it and establish a second pen, then a third and a fourth, and so on, *ad libitum, ad infinitum*. Brother Briggs admits, however, that you would get a better profit by bestowing a little more labor besides gathering the eggs; and the next chapter describes this matter and tells how to get the most profit by the least expenditure of labor.

Of course, this is an old story that has been gone over again and again, and my poultry experiments down in Florida were made particularly with that end in view, to see how near I could make the whole thing automatic and still have it pay a profit. Well, it did very well when I was there to keep an eye on things; but when I came away and turned over my poultry-ranch, with something like a hundred laying hens, to my good friend and neighbor E. B. Rood, then came the test. Suppose we grant, for illustration, that a poultry-ranch of moderate size could be so managed that there would be practically nothing to do but to gather the eggs daily, and fill up the hoppers, say once a week; can we *still* make the institution pay if we do not live on the poultry-farm, but employ somebody to gather the eggs and keep the chickens supplied with food? Well, with this end in view I left my chickens with neighbor Rood. Several times during the summer I have sent him a postal card asking him how the speculation turned out. For a little time he said the chickens were doing very well. Pretty soon there was no report; and finally when I urged a little the following came:

Dear Mr. Root:—I am very sorry to be compelled to state to you that the chickens are not laying as well as I think you will get them to after you come down. In fact, I have about decided that chickens are social creatures, and do better when there is some one about with whom they can commune once in a while. This may not be true of *all* chickens, but it seems to be true of Mr. A. I. Root's chickens at least. Possibly they were brought up under such social surroundings that society is necessary for them. I know that their food has not enough variety, and I thought that I would feed them ground meat, but after trying it for a while I got lazy and quit. You learned long ago that a lazy man had better leave chickens alone. Eggs are 30 cts. a dozen. I get from five to twenty a day from both yours and mine—as many some days from mine as from yours. I hope to have lots of lettuce, cabbage, and cauliflower for them after a while, and then they may do better. Your little rubber-tree is a beauty, and nearly every thing has done well. We shall be glad to see you. E. B. Rood.

Bradentown, Fla., Oct. 5.

Now, friends, there is a big moral right here. It looks to me as if chickens really do crave the companionship of human beings. They want to be petted and complimented occasionally. They need to be in close touch with somebody who knows them by name and loves them. Do you know what the dear Shepherd said about the sheep? Well, it is true of chickens also. By the way, Mrs. Root thinks the idea of having nothing to do but gather the eggs is a big joke; and she says if any of the readers of GLEANINGS think I had nothing to do but gather my eggs down in Florida they ought to have been around when I

was trying to "gather" my surplus young roosters. Of course, I got 20 cts. per lb. for them; but she said she was a little afraid it would wear me out, mentally and bodily, in getting those young roosters in a cage to send to market. You see, down there they roost away up in the pine-trees; and my flock of sixty White Leghorns here in Ohio have been roosting up in the evergreens which surround our apiary. I succeeded in getting them out of the evergreens and driving them into the orchard; but just now all but about a dozen positively insist on roosting in a big apple-tree that overshadows the poultry-house, instead of staying indoors. If any of our readers can tell me of a quick way of getting these chickens out of the tree and into a cloth-curtain poultry-house, say along about Thanksgiving time, I shall be greatly obliged to them.*

Now, I do believe we can have things so arranged that the amount of real work needed to care for a flock of fifty or a hundred chickens would not amount to much; but when somebody tries to persuade you that they can be so managed that you will have comparatively "nothing to do but gather the eggs," do not be too ready to accept the statement. When it comes to setting hens or running an incubator, and caring for the brooder, to say nothing of hawks and other "varmints," I think you will be likely to have exercise enough to give you an appetite about every mealtime. At the same time, when your fowls are carefully fenced in with a good high poultry-netting, so as to make sure that no live animals can crawl or burrow under it, with large-sized feed-hoppers, feed and shelter, and abundance of green food, you can so manage that there will be a good many days when there will be but little to do but "gather the eggs."

TEMPERANCE

A JUG OF WHISKY FOR A CHRISTMAS PRESENT.

On page 708, June 1, I told you of a tragedy that took place near where I started a Sunday-school, in Osprey, Fla. There was one family in the neighborhood that had had a great deal of trouble. The poor wife had been insane, and had been in an asylum; but she had come home so much better that she was taking care of the children, fixing them up, and finally for the first time, perhaps, in many years, the father and mother and children all came out to a Christmas-tree festival on Christmas eve. They felt bright and happy, and all the neighbors felt glad to see them out once more among folks, and especially at a gathering of that kind. Besides the insanity trouble, the poor mother was stone deaf—she could not hear a word. Well, this man was in the employ of a millionaire brewer. He may not have been quite a millionaire, but he was wealthy. He had bought a place near the Sunday-school chapel, and employed the man of whom I have been speaking as laborer. Just before the holidays he gave all of his helpers a *jug of whisky for a Christmas present*. I think the man who received the whisky did not drink; but a couple of other fellows who did drink

found out about it, went to his home some time after midnight, rapped on the door, and demanded that jug of whisky. Of course, the poor wife did not *hear* any of the racket. The first intimation she had of what was going on was to find her husband's dead body out in front of their home. He was shot because he would not hand over that whisky to a couple of men who were already crazed by drink until they were ready to commit murder or do any thing else. This poor woman (who had at the time a nursing babe) became mentally unhinged again, and who can wonder? They decided she was not fit to take care of her babe, but she declared she would have it, and they had to confine her by main strength to keep her quiet. A little time after that, this wealthy brewer, who gave the whisky as a Christmas present, *committed suicide*, and I have just read in the *Manatee River Journal* that the two men who committed the murder are sentenced to go to the penitentiary for life. Well, this whole thing was again brought to mind by a glaring advertisement of "STRAIGHT KENTUCKY WHISKY FOR CHRISTMAS, 1908." Now, friends, what do you think of the man or men who are so far lost to all sense of Christianity, honor, and decency, as to suggest a *jug of whisky for a Christmas present*?

HEALTH NOTES

HEALTH, HOME, AND TEMPERANCE.

Mr. Root:—I will say, in reference to your little editorial note in last issue of GLEANINGS, that I think your misgivings as to the acceptability of your Home and Temperance Departments are entirely unfounded. These are to me a delightful inspiration and strength, and are undoubtedly the same to thousands of your readers. So far as I am concerned, if you and Mr. Terry keep to your purpose, and live to be centenarians, I hope you will both remain active in your literary pursuits and contributions to the cause of health and temperance. In your food hints, I should be pleased to have your views as to the value of honey for food.

Salem, Ohio, Nov. 12.

T. S. TEAS.

Thanks, friend T. Regarding honey of late years, as I have told you, I find my health very much better when I use little or no sweets of any kind; and I have to be especially careful about cane sugar. A very little well-ripened honey, better still sterilizing it by setting the dish in the oven until the honey is very thick, seems to be all right, say perhaps a few spoonfuls with my rolled wheat. Milk and honey are both *uncooked* foods. I have mentioned before that young people, especially growing children, no doubt require more sweets than grown-up people, especially elderly ones. In the same way, any one who is doing muscular work, and especially outdoors, and more especially still in cool weather, needs sweets of some kind in the same way the Esquimaux need a great amount of fat to furnish fuel for the body. Where honey seems to agree with you nicely, by all means use it, and thank God for it. But I think it is well for us all to be careful about taking our honey or any other dessert after we have made a good square meal. The new diseases that are constantly coming up to afflict our people are, without doubt, caused by overloading our digestive apparatus; and this is often done through carelessness or ignorance. Look out, and beware of "clogging the machinery."

* *Later:*—I finally got them all safely "corralled," during a big snowstorm.

Why Rent?

when there are 500 Government irrigated homesteads at Powell, in the Big Horn Basin, Wyoming and Huntley in the Yellowstone Valley, Montana, with water now running in the canals, ready to raise crop next year.

WATER PAYMENTS EASY AS RENT, one-tenth cash, one-tenth in two years and one-tenth each year thereafter until full amount is paid. **NO INTEREST.** Settlers allowed to work out payments on extensions of Government Canal at good wages. A never failing supply of water for irrigation.

YIELDS: 50 bu. wheat, 90 bu. oats, 70 bu. barley, 3 cuttings alfalfa, 250 to 500 bu. of potatoes, 20 to 25 tons of sugar beets. Good fruit land.

Let Us Help You Locate. Go with me on one of our personally conducted excursions, first and third Tuesdays of each month, and I will help you **free of charge** to find a satisfactory homestead, or purchase deeded or Carey Act land. I will not advise you to settle where the elevation is too high, or the water supply defective.

Write Today for our new folder with large map, also folders issued by the Government telling about the homestead lands.

"My Wife Is Mighty Sick; Come at Once, Doctor!"

An Independent Telephone is more of a necessity on the Farm than in the City.

It acts at once, day or night, when delay might be fatal.

It enables you to keep in touch all the time with all your interests—the postoffice, the weather reports, the markets, the stores, and your neighbors.

It works faster and cheaper than the railroad train, the trolley car, or the mails.

It saves you time, money and labor.

Stromberg - Carlson Independent Telephone

equipments are the best and are sold at reasonable prices.

Our directions are so plain and simple that anyone can put up a line with little effort.

Ten Men Can Organize a Successful Independent System

Write us today for our free book, "How the Telephone Helps the Farmer," 21st edition, and two other booklets that will tell you all about it. You will find them interesting reading.

Ship Us Your Hides To Tan

and we will make them into warm, comfortable coats with high collars, or into robes, mittens, jackets, ladies' furs, etc. and save you a lot of money.

We tan by nature's method only and use no chemicals or dyes which cause the hairs to shed. Color makes no difference. Almost any hide looks well when made up into a fine comfortable robe or coat. Will resist cold, wind, rain or snow; are soft and pliable as cloth and very little heavier.

Instead of selling your hides to the butcher, let us make them into useful garments that will wear for years and enable you to enjoy the coldest weather.

If you send in your hides now, we will pay the freight on all hides sent to be made into coats and robes and give you **FREE**—with each cow- or horse-hide coat or robe, a pair of fur knit-lined mittens with horse-hide palms. If you have no hides to send us we can

Sell Your Furs and Save You Dollars

We not only tan the hides you send us, but we have in stock hides and skins from which we manufacture to-measure coats, robes, neck-pieces, ladies' jackets, children's coats and fur goods of every description. We make to order any kind of fur goods. Write for catalog and prices.

\$1.00**All****\$1.00****For a Dollar.**

The SOUTHERN FRUIT GROWER is the best paper I have ever read. L. H. Kessler, Agawam, Mass.

I have been a regular subscriber to the Southern Fruit Grower from almost its beginning, and enjoy it very much.—J. B. WILLIS, Spartanburg, S. C.

I am nearly 80 years old, still I do not feel like being without the Southern Fruit Grower.—A. BORNSTEIN, Cedar Hill, Tenn.

These are only a few of thousands of subscribers who tell us what they think of the Southern Fruit Grower after reading it regularly for a number of years. If you have an orchard or garden, we know it will please you just as well as it does others. It will **save you money**, and many single issues are worth more than 50 cents, the subscription price for a year; but we want your subscription for three years—\$1.00. Send us the dollar at once and we will send you, absolutely free, three of the following ferns and include a year's subscription to the Household Journal:

DESCRIPTION OF FERNS:

BOSTON FERN.—The most popular fern. For hanging-baskets or single specimens it is certainly fine; will do better with the amateur than any other variety.

OSTRICH-PLUME FERN.—The fronds grow in the most luxuriant manner, each pinna forms a perfect miniature frond, giving it a feathery appearance.

NEPHROLEPIS WHITMANII.—An improvement in the "Elegantissima," with still more gracefully divided pinnae, giving the whole plant an airy lace-like appearance.

SEND IN YOUR ORDER TO-DAY.

STAMFORD, CONN.

Edward F. Bigelow, Managing Ed.

For people who see and think.

For people who believe that this is a beautiful and interesting world.

For all students and lovers of nature.

SUBSCRIPTION, \$1.50 PER YEAR.
SINGLE COPIES, 15c. NO FREE COPIES.

Every number is worth more than the price asked, costs more—therefore we can not distribute free.

HILTON'S Strain of Bees and What They Did

Dear Friend Hilton:—The two three-frame nuclei I received of you May 21 were received in fine condition, and the red-clover queens proved themselves worthy of the name. I never saw finer or gentler bees. They were transferred to ten-frame hives and full sheets of foundation. I now have four strong colonies, with plenty of stores for winter, and have taken 195 lbs. of fine extracted honey, mostly clover. I want two more nuclei for next spring delivery, and my neighbor wants another. You may use this letter or any part of it as you choose.

Gratefully yours,
Rhineland, Wis., Sept. 14, 1908. G. C. CHASE.

In addition to the above I have sold friend Chase about \$200 worth of ROOT GOODS, which deserve some credit for the above results—the best of every thing is none too good. ROOT'S GOODS and GLEANINGS helped. If you are not taking GLEANINGS, WHY NOT? For an order of \$10.00 before Jan. 1 I will give GLEANINGS one year; \$20.00, two years; \$30.00, three years; or you may have GLEANINGS from now to the end of 1909 for \$1.00; two years for \$1.50; three years for \$2.00. SEND FOR MY 40-PAGE CATALOG. CASH FOR BEESWAX, or will exchange goods for it.

GEO. E. HILTON
FREMONT, MICH.

Merry Christmas

We're talking to the wives and daughters in the families where GLEANINGS goes. Why don't you get him something that will suit him better, than any thing else for Christmas, and that is to renew his subscription to GLEANINGS or get him a copy of the new 1908 edition of the A B C and X Y Z of Bee Culture?

Offer No. 1

Gleanings one year, and a bee-veil with a silk tulle front, \$1.15.

Offer No. 2

A B C and X Y Z of Bee Culture, 1908 edition, and bee-veil, both postpaid, \$1.65.

Offer No. 3

Gleanings one year, A B C and X Y Z of Bee Culture, and bee-veil, all postpaid, \$2.40.

EXTRA

The Christmas number of GLEANINGS, and all of 1909 are included.

We will mail to separate addresses parts of the same offer.

When requested we will send a personal letter to any address announcing the offer as a Christmas gift, and giving the name of the giver.

We will mail so as to reach destination as near Christmas Day as possible.

No matter where you are located in the United States, you can take advantage of these offers.

New Goods for 1909

Good News for the Southwestern Bee-keeper

The strenuous season of 1908 left our stock of bee-supplies in a depleted condition. We have now replenished our stock with large shipments of the finest bee-goods ever seen in the Southwest. These are

Root's Goods Exclusively

We have not dared to experiment with any other line of bee-supplies; and from the looks of our new goods we shall never need to. They are "as fine as silk." We should be glad if our customers would come and see them. You will be pleased with the best ever. Come along and enjoy a day in San Antonio, picking out what you want while your wife goes shopping. Seeing is believing, and we would far rather hear you puff our goods than do it ourselves. But we honestly believe we have not only the largest line of bee-supplies in Texas, but also, by far, the best in quality.

Order Now

Please don't wait till the last hour before ordering, when we are buried out of sight with orders all wanted the same day we receive them. Last spring we lost a great deal of sleep on account of being swamped with orders, and we had to work far into the night to catch up. Some nights we worked all night long. We know there are many who can just as well order right now, and save both themselves and us considerable anxiety during the busy season.

Early-order discount—4 per cent for January; 3 per cent for February.

Catalogs Free on Demand

With our catalog in hand you can pick out the various items required, at your leisure. When you make out an order, send it to us and we will do the rest. It will be regarded as a favor from you, and be appreciated accordingly.

Toepperwein & Mayfield
1322 South Flores St.
San Antonio, Texas

FASHION BOOK FREE!

I want to send you my handsome new book showing hundreds of latest styles with illustrated lessons on cutting and dressmaking. I will agree to sell you all the patterns you want for five cts. each. They are the same patterns you have always paid 10c & 15c for at the stores, made by the same people, and correct in every detail.

HOW I DO IT.

I publish the **FARMER'S CALL**, a weekly paper for every member of the family. An especially interesting feature each week are the children's letters; and the Woman's Department is unusually strong and instructive. Among the special features for Women folks, is its fashions in which I show the **5c patterns**. Let me help you to save money.

MY SPECIAL OFFER

Send me 25c and I will send you the **Farmer's Call** every week (over 1000 pages) for one year and will send my big Fashion Book to you free. I also agree to sell you any pattern you want thereafter for **5c**. I can sell them for 5 cts because I buy them by the thousand and don't make any profit. I don't want the profit. I want your subscription to the **FARMER'S CALL**. You will save many times the cost of my offer in a year. **WRITE TO-DAY!**
JOHN M. STAHL, Dept. G, QUINCY, ILL.

BEE-SUPPLIES FOR SEASON OF 1909

Complete stock on hand, as our plant has been running steadily so as to take care of the demand for **bee-supplies** the early part of the coming season. We are practically overstocked at this time and advise those in need of **bee-supplies** to order now (shipments may be delayed until you want the goods) before the contemplated advance in prices all along the line. Lumber is dearer and labor has never been so high, but we agree to protect our patrons at present prices upon receipt of their orders at this time.

Being manufacturers we buy lumber to advantage, have lowest freight rates, and sell on manufacturers' profit basis. Let us quote you prices. Prompt shipment guaranteed.

Honey and Wax for Sale

FOR SALE.—50 cases of raspberry-basswood blend of extracted honey; two new 60-lb. cans to the case, f. o. b. Boyne Falls, Mich., where our north bees are located, at only 9 cents per lb., left on the hives until August before extracting, then nothing but all seasoned honey was put into this grade. The unsealed combs were extracted by themselves, and went to the baker. By this mode of handling there is nothing on the market to compare with this stock, and the price is only a little above the ordinary for this rich, delicious, ripe stock. Many pages could be filled with testimonials of my superior stock of extracted honey, but I have room for only one, the last one in:

WEST SENECA, N. Y., Dec. 2, 1908.

E. D. Townsend, Remus, Mich.

DEAR SIR:—The honey arrived O. K. It is the finest I ever tasted. Yours truly, F. W. HALL.

I can furnish circular and sample of this honey for the asking.
E. D. TOWNSEND, Remus, Mich.

FOR SALE.—My new crop of white-clover extracted honey. Honey has been left in full charge of the bees for three weeks after harvest, and is rich, waxy, and of fine flavor, and is as good as a specialist can produce. Price is 8c. per lb. by the case of 120 lbs. or for the entire crop. Cash to accompany order.

LEONARD S. GRIGGS, 711 Avon St., Flint, Mich.

RASPBERRY HONEY, left on the hives until thoroughly ripened; thick, rich, delicious; put up in new 60-lb. tin cans; \$6.25 for one can; two or more cans at \$6.00 per can. Sample ten cents, and the ten cents may apply on the first order.

W. Z. HUTCHINSON, Flint, Mich.

FOR SALE.—Buckwheat, amber, No. 2 white comb, \$2.50 per case of 24 sections; unfinished and candied comb, \$2.00 per case; amber extracted ($\frac{3}{4}$ clover), two sixty-pound cans to case, at 8 cts.

QUIRIN-THE-QUEEN-BREEDER, Bellevue, O.

FOR SALE.—Choice extracted honey for table use, gathered from clover and basswood—thick, well ripened, delicious flavor. Price 9 cts. per lb. in 60-lb. cans, two to case. Sample, 10 cts.

J. P. MOORE, Queen-breeder, Morgan, Ky.

FOR SALE.—I have some extracted honey, well-ripened, fine, clover and basswood, in new five-gallon round cans, at \$5.50 a can; sample free; delivered f. o. b. cans here; ought to suit anybody.

MATHILDE CANDLER, Cassville, Wis.

FOR SALE.—Clover, amber, and buckwheat extracted honey. Table quality. Write for prices, stating your needs.

C. J. BALDRIDGE, Homestead Farm, Kendaia, N. Y.

FOR SALE.—Choice white-clover extracted honey, in new 60-lb. cans, or any shape desired. Ripened on the hives and guaranteed strictly pure. Sample free. J. F. MOORE, Tiffin, O.

FOR SALE.—Fine extracted white-clover honey; also light amber fall honey, put up in barrels, 60-lb. and 10-lb. cans. Write for prices. DADANT & SONS, Hamilton, Illinois.

FOR SALE.—1000 gallons of extracted white-clover honey in 60-lb. cans, two to a case, at 8 cts. per lb. by the case, or for the entire crop f. o. b. cans here. ADAM BODENSCHATZ, Lemont, Ill.

FOR SALE.—Honey by the barrel or case—extracted and comb; a bargain in honey. Write now.

JOHN W. JOHNSON, Box 134, Canton, Mo.

FOR SALE.—About 2000 lbs. of fine comb honey, mostly smartweed and Spanish needle; extra nice.

JOHN A. THORNTON, Ursa, Ill.

FOR SALE.—Eight tons of extracted alfalfa honey, perfectly ripened, $7\frac{1}{2}$ cts. per lb.

V. V. DEXTER,
North Yakima, Wash.

FOR SALE.—Buckwheat extracted honey, 160-lb. kegs at $6\frac{1}{2}$ cts.; 60-lb. tins at 7. J. I. PARENT, Ballston Spa, N. Y. Rt. 2.

FOR SALE.—2000 lbs. No. 1 clover and basswood extracted honey in 60-lb. cans. FRANK MONTEFELT, Juda, Wis.

FOR SALE.—2000 lbs. white-clover extracted honey, 8 cts. in barrels; $8\frac{1}{2}$ in 60-lb. cans. G. RUTZAHN, Biglerville, Pa.

FOR SALE.—Best quality alfalfa in cases of two 60-lb. cans, \$8.40 per case, f. o. b. here. H. E. CROWTHER, Parma, Ida.

FOR SALE.—Fine buckwheat honey in new cans. Send for sample and prices. EARL RULISON, Rt. 1, Amsterdam, N. Y.

Honey and Wax Wanted

WANTED.—Comb, extracted honey, and beeswax. State price, kind, and quantity.

R. A. BURNETT, 199 South Water Street, Chicago, Ill.

WANTED.—25 tons of fancy comb honey. Write, stating particulars, to C. M. CHURCH, New Kensington, Pa.

WANTED.—Choice extracted basswood or clover honey. Prompt payment on receipt. Write full particulars, with sample. H. C. AHLERS, West Bend, Wis.

For Sale

FOR SALE.—A full line of bee-keepers' supplies; also Italian bees and honey a specialty. Mellilots (sweet clover) seed for sale at 8 cts. per lb. Write for catalog and particulars.

W. P. SMITH, Penn, Miss.

200 Bee Hives at a sacrifice; practically as good as new; set up and well painted, ready for the bees. Shipped to take K. D. rate. Regular Dovetailed and Langstroth, \$1.00 each. Langstroth-Simplicity and plain joint hives, 75 cts. each; four-frame automatic extractor, \$17.00. 60-lb. can honey, \$5.95.

L. M. GULDEN, Osakis, Minn.

FOR SALE.—One model F. Ford two-cylinder 16-horse-power five-passenger automobile. The rear seat is easily taken off, and we have used this car for delivering honey and for visiting our apiaries—a fine car, good as new. Write us for price and information.

JOHN A. THORNTON, Ursa, Ill.

FOR SALE.—One Pineland 300-egg incubator, cost \$50.00, in perfect working order; 100 clear-pine $\frac{7}{8}$ -inch egg-cases, planed and painted; heavy berry-crates, painted; or will exchange for bee-hives, crates, etc., foot or power saw, or any thing useful to me.

L. C. JUDSON, Franklin, N. Y. R. D.

FOR SALE.—Female Scotch Collie, one year old; thoroughbred, affectionate and obedient; well marked, and a fine individual. Write for price and pedigree.

C. A. WURTH,
Fayetteville, Ark.

340 Fourth Street, Ogden, Utah.

FOR SALE.—Apiaries and queen-rearing business in Southern California. Full particulars on request to
E. M. GRAVES, Iamosa, San Bernardino Co., Cal.

You can win out if you send a postal for my Circular of Italian and Caucasian queens. Nothing like it. A. D. D. WOOD,
Box 61, Lansing, Mich.

FOR SALE.—100 colonies of Italian bees, with outfit and fixtures. Price reasonable.
CLYDE CLEMENS,
Crawfordsville, Iowa.

Wants and Exchanges

WANTED.—Bees for second-hand hives, thoroughly cleaned by steam; size 16x16; 10½ inches deep, ten-frame; suitable for the production of comb or extracted honey. Many of these hives are almost new. Would consider sending a carload to some responsible Texas apiarist in good locality for increase to fill on shares.
THOS. J. STANLEY, Manzanola, Otero Co. Colorado.

WANTED.—1000 extracting-combs, small steam-engine, and bee-supplies; also have a fine set of watchmaker's tools and material; will trade or sell. Spit it out quick.
JOHN H. KOONTZ, Stewardson, Ill.

WANTED.—To buy a home and apiary in a good honey location, free from bee diseases, with good fishing and drinking water. Western States preferred. Give price and terms in first letter. Address
TRANSIENT, Sunny Side, Cal.

WANTED.—Refuse from the wax-extractor, or slumgum. State quantity and price.
OREL L. HERSHISER,
301 Huntington Ave., Buffalo, N. Y.

WANTED.—To exchange berry-plants, the best varieties that grow, for foundation and bee-supplies.
JOHN D. ANTRIM, Burlington, N. J.

WANTED.—400 colonies of bees in California or Texas.
DR. GEO. D. MITCHELL & CO.,
340 Fourth Street, Ogden, Utah.

WANTED.—A foot-power saw in good condition, for spot cash.
F. W. BUCK, Muncy Valley, Sullivan Co., Pa.

WANTED.—To buy an apiary in the South. State lowest cash price.
WM. CARDER, Ludlow, Ky.

WANTED.—An apiary on shares in California.
P. C. SPRINGBORG, Thermal, Cal.

WANTED.—50 chaff hives for L. frames. State conditions and price.
R. S. MARSHALL, Tribes Hill, N. Y.

Help Wanted

WANTED.—Capable man 30 to 40 years of age, married, to take charge of small farm in Ohio. State experience, salary wanted, date could begin, and give names of references. Address
JOHN SMITH, Gleanings in Bee Culture, Medina, O.

WANTED.—A hustling helper in the bee and honey business; preferably one who would have some money to invest with a view to securing an interest in a well-established and paying business.
B. WALKER, Clyde, Ill.

WANTED.—Three experienced apiarists. One must understand queen-rearing; 5 yards, 1100 colonies. State age, nationality, and salary expected.
R. M. SPENCER,
Nordhoff, Cal.

Situation Wanted.

WANTED.—Situation. I have put in 14 straight years of up-to-date bee culture; am able to take charge of large interests; am 36 years old, strictly temperate; wish to work on shares if possible. Address A. LANZ, Fairmont, Los Angeles Co., Cal.

WANTED.—Position with bee-man for 1909 by a young man 33 years of age; honest and upright; no use for tobacco or liquor; have worked one season with a bee-man. Distance is no objection; or I should like to buy out some bee-man or go halves.
CARL ERIKSON, St. Ansgar, Iowa.

WANTED.—To correspond with California bee-keepers who could use an old man who is well posted in the bee business. I have had long experience in large apiaries.
J. LAWRENCE, Box 120, Soldiers' Home, Los Ang. Co., Cal.

Post Cards.

Eight beautiful Christmas or New Year's Cards mailed for 15c; 13 for 25c. Also birthday, comic, or miscellaneous cards. Say what you wish, and whether for adults or children.
M. T. WRIGHT, Medina, Ohio.

Bee-keepers' Directory

I no longer club a queen with GLEANINGS.

QUEENS.—Improved red-clover Italians, bred for business, June 1 to Nov. 15, untested queens, 60 cts.; select, 75 cts.; tested, \$1.00 each. Safe arrival and satisfaction guaranteed.
H. C. CLEMONS, Boyd, Ky.

Improved Italian queens now ready. Nuclei and colonies May 1 to 10. Over twenty years a breeder; 500 colonies to draw on. Free circulars and testimonials. For prices see large advertisement in this issue.

QUIRIN-THE-QUEEN-BREEDER, Bellevue, O.

ITALIAN BEES AND QUEENS. I breed three-banded stock only, and use the finest breeding stock to be had. Send for price list. Twenty-five years' experience.
F. J. WARDELL, Uhrichsville, O.

Breeding queens of pure Caucasian and Carniolan races—price \$3.00. Order from A. E. Titoff, Expert in Apiculture, with Russian Department of Agriculture, Kieff, Russia. Remit with orders. Correspondence in English.

Real Estate for Bee-keepers

PECOS VALLEY of New Mexico lands are coining \$50 to \$65 net per acre per year from alfalfa. Forty-five thousand acres of alfalfa in bloom five times a year, surrounding Artesia, means *honey for the bee-keeper*. Live in an ideal fruit country, where the largest artesian wells in the world constantly pour out their wealth. Artesia, the future Rose City, already has the famous "Mile of Roses." Homeseekers' excursions the first and third Tuesdays of each month. Agents wanted, to accompany parties. Write to-day to R. M. LOVE, General Agent, Artesia, N. M.

FOR SALE.—Five or ten acres in the beautiful town of Orlando, Fla. Will sell very cheap, or exchange for Canadian property.

C. H. LEWIS,
85 Victoria Ave. N., Hamilton, Ont., Can.

FOR SALE.—In Franklin Co., Tenn., 87 acres of land 3 miles from railroad; 40 acres cleared, the rest in timber. For terms apply to

W. T. LYONS, Decherd, Tenn.

FOR SALE.—32 acres land, orange-grove, apiary and chicken ranch.

J. W. BANNEHR, Bradentown, Fla.

SPECIAL NOTICES

BY OUR BUSINESS MANAGER

Subscribers who want their friends to see and have a copy of our Christmas issue may refer them to their local news-stand where this issue will be on sale.

MARKETING HONEY.

The problems of the bee-keeper have not all been solved when he has learned to secure each year the largest crop of honey possible and put it up in the most marketable shape, for it has been apparent that large losses are sustained by some of the most capable honey-producers when they come to market the product of their apiary, the entire honey crop of the season.

One of the chief causes of the losses referred to has been the shipping of large consignments of honey by bee-keepers to unreliable dealers. Another is the shipping to commission houses who have no regular trade in honey, and who are, therefore, unfamiliar with its proper care and do not know where or when to put it on the market to the best advantage. For a number of years, though not so frequently of late as was the case some five years and more ago, we received, every fall, reports from bee-keepers who had been swindled out of large shipments. To avoid this we have endeavored to give the announcements of the most reliable honey-dealers in our columns regularly, and in this way head off unreliable people who solicit shipments of honey from unsuspecting bee-keepers. We take pleasure in calling particular attention to the advertisers whose announcements are found in this issue, as they represent the large honey-dealers throughout the country. Do not make the mistake of shipping to your nearest city, as it may be found that some other market may be better. On the other hand, inquire about several markets, and you may find it an advantage, after getting a satisfactory outlet with a certain dealer, to stay with him year after year, even though another market may be a little more tempting occasionally. If you want to buy honey you should certainly get prices from those dealers who advertise honey for sale before making your purchase. They can save you money in many instances. Preserve these advertisements for frequent reference.

JAPANESE BUCKWHEAT SEED.

We have secured a nice lot of seed of the Japanese buckwheat, grown for us the past summer. As it is out of season we are willing to make quite a concession in price to reduce stock at present. For orders placed before January 15th, accompanied by payment, we will furnish seed in new bags, included without extra charge. One bushel, \$1.25; two bushels, \$2.25; ten bushels, \$10.50.

SWEET-CLOVER SEED.

We have on hand a good stock of choice sweet-clover seed, both white and yellow. Of the white we have both unhulled and hulled seed, and of the yellow we have at present about 250 pounds hulled, and have engaged a lot of unhulled yellow which is expected to arrive soon. It is usually difficult to supply the entire demand of unhulled white and yellow, and we suggest immediate orders to be sure of getting from our present stock. Prices are as follows:

	1 lb.	10 lbs.	25 lbs.	100 lbs.
Unhulled white, per pound,	\$.15	\$.13	\$.12	\$.11
Hulled " " "	.22	.20	.19	.18
Unhulled yellow " " "	.18	.16	.15	.14
Hulled " " "	.25	.23	.22	.21

The prices are all subject to market changes.

SECOND-HAND COMB-FOUNDATION MILLS.

We have to offer the following list of comb-foundation mills, which have been used but are in good condition to use, by one who wants to make his own foundation and is not particular about slight defects in the cell faces. Samples from these machines will be mailed to those interested on application.

No. 075.—2x9-inch round-cell, medium-brood mill in fair condition. This is a very old pattern, made about thirty years ago; has been kept in good shape. Price \$10.00.

No. 079.—2½x6 hex. cell extra-thin-super mill in good condition; bargain at \$12.

No. 084.—2x10 round-cell medium-brood mill in fair condition. Price \$12.00.

No. 085.—2½x6 hex. cell thin-super mill in very good condition. Price \$12.00.

No. 086.—2½x6 hex. cell extra-thin-super mill in excellent condition. Price \$15.00.

No. 092.—2½x6 hex. cell extra-thin-super mill in extra good condition. Price \$15.00.

No. 0100.—2½x6 hex. cell extra-thin-super mill in good condition. Price \$10.00.

No. 0102.—2½x6 hex. cell extra-thin super mill in good condition. Price \$10.00.

No. 0103.—2½x10 hex. cell medium-brood mill in fine condition. Price \$18.00.

No. 0104.—2½x10 hex. cell medium-brood mill in good condition. Price \$16.00.

No. 0105.—2½x10 hex. cell light-brood mill in fair condition. Price \$10.00.

HONEY-PAMPHLETS.

To answer the numerous inquiries we are receiving regarding prices on the pamphlet entitled Food Value of Honey, by Dr. C. C. Miller, we quote the following:

Prices: 10, 5 cts.; 100, 20 cts.; 500, 75 cts., all postpaid; 1000, 75 cts.; 5000, \$3.50; 10,000, \$6.50. If you desire your own name and address on the first page, add \$1.00 extra to the above prices. Should you desire your own advertising card on the last page instead of our own, the price will be \$1.50 more; or \$2.50 extra for your name and address on the front page, and your advertising card on the last page. Already folded, the price will be 50 cts. per 1000 extra.

Convention Notices.

The University of Tennessee, Knoxville, again announces a course in bee-keeping, March 1—13, conducted by Prof. G. M. Bentley. The subjects are, study of the habits and development of the honey-bee; types of bees; queen-rearing; methods for improving run-down apiaries; diseases and parasites; with remedies, management of an apiary; types of hives; the out-apiary; selection and culture of bee-plants. For particulars, address Prof. Bentley.

BEE-KEEPERS' ATTENTION.

The annual meeting of the Missouri State Bee-keepers' Association will convene at the county court-room of Columbia, Mo., Jan. 6, 1909, at 9 A. M. and will remain in session for two days. All persons interested in bee-keeping are invited to attend the meetings.

An interesting program will be prepared that all bee-keepers present may be benefited.

Our meeting takes place during Farmers' Week, when also the Horticultural Board, the Live-stock Breeders, the Dairymen, Sheep-breeders, Swine Growers and Breeders, Highway Engineers, and Housekeepers' Conference will meet, and the members of the State Board of Agriculture will be present at Columbia.

Accommodation can be had at the hotels, or at reasonable rates at private boarding-houses.

ROBT. A. HOLEKAMP, Sec.,
4263 Virginia Ave., St. Louis, Mo.

The Northern California Bee-keepers' Association will hold its third annual convention on the 21st and 22d of December, at Pioneer Hall, Sacramento Seventh St., between J and K. This association is composed entirely of honey-producers; was organized by them and for their benefit alone. It aims to help those with a few colonies as well as those whose colonies number into the hundreds.

The benefits to be obtained from attending these meetings are many.

I. In a social way.

Here we meet our old friends and renew friendships; also meet many new members.

II. In obtaining knowledge pertaining to our chosen pursuit.

At these meetings there are also many practical bee-keepers who have made money keeping bees and are ready to talk on any subject pertaining to the industry, telling of their success and failures of past years, and no member can help being benefited.

F. J. LEWIS, President.
B. B. HOGABOOM, Sec.-Mgr.

Special Notices by A. I. Root

MY 69TH BIRTHDAY.

To-day, Dec. 9, I am 69 years old, and thanking God that our five children and eight grandchildren are all alive and well. The last arrival, a week ago to-day, is especially alive when the time comes for her "ration." Mrs. Root and I expect to leave for Florida just as soon as I can get in my vote, December 15, to make Medina Co. dry.

THE WRIGHT BROTHERS UP TO DATE.

If I am correctly informed, Orville Wright has so far recovered that he has left his home in Dayton, Ohio, and is now on his way to join his brother in France; and the papers tell us that his brother, Wilbur Wright, now has hopes that he can construct a flying-machine that will fly without a motor. I can not understand what he means by this unless he has reason to think it possible to find ascending currents that will take him up into the air, and that, when once aloft, he can guide his ship so as to find other ascending currents that will enable him to fly as birds do for hours without flapping a wing. Perhaps this is only a newspaper fiction; but there may be a kernel of truth in it after all.

TWO SWARMS IN ONE DAY.

"Well, what of it?" you may ask. Two swarms of bees in one day is certainly nothing remarkable for a bee-keeper with even a small apiary. But these two swarms I have in mind came in December; but even this would be nothing remarkable if it had happened down in Florida; but it was not in Florida, but in Medina, O., on the 2d of December, 1908; and if you will let me explain a little I will tell you why it was an event in the eyes of all Rootville. Mrs. Root had just one sister, the wife of Neighbor H., who used to be a bee-keeper, and write for GLEANINGS. Well, Neighbor H. has a daughter, and this daughter is only about five weeks older than her cousin, Carrie Belle Root, now the wife of Llewellyn W. Boyden. Well, these two cousins each gave birth to a little stranger, and both came to Rootville (strange to tell) on the same day, and only a few hours apart, and, of course, there is great rejoicing. One is a boy, and the other is a girl. The father of the boy is our head book-keeper, Mr. Neal Kellogg. The father of the girl baby is Mr. Boyden, a younger brother of A. L. Boyden. Mr. L. W. Boyden, as you may remember, has until recently had charge of our house in New York city. Of course you will recall what I have told you, on several other similar occasions, that no colony of bees can be really prosperous unless brood-rearing is going on pretty nearly every month in the year. There must be frequent accessions of young blood to keep up and perpetuate a healthy growth in the parent colony. May God be praised for all his mercies; and may he help us all to remember the responsibilities that rest upon us to train up these little ones in such a way that when they get old enough they will, of their own accord, hold fast to "the straight and narrow path."

WHAT PERIODICALS WILL YOU SUBSCRIBE FOR, FOR 1909?

You may be aware, friends, that we exchange with more than a hundred periodicals of different kinds; and just now I am called on to consider which ones I shall select, from this great array, for reading in my Florida home during the coming winter.

First I want the *Sunday School Times*, because its standard of morals, not only in its reading columns but in its advertisements as well, is higher, it seems to me, than perhaps that of most of the religious periodicals.

Next I want the *Rural New-Yorker*, because it not only also upholds the highest and best morals, but it shows up swindlers, fearlessly and unsparingly, and everybody else who preys on the homes of our land.

Then I want the *Practical Farmer*, because T. B. Terry tells us in it every week how not only to live but to live and be happy until we are a hundred years old, or less.

Then I want the *Ohio Farmer*, because, while it posts us on every thing belonging to the farm and to farm life, it also puts in tremendous sledge-hammer blows against the American saloon.

Next I want the *Country Gentleman* because it is a country gentleman, and dignifies the farmer's calling.

I want also the *Farm Journal*, which, while it holds up righteousness and temperance, as well as agriculture, costs so little that it is almost a shame to be without it.

And there may be still other farm periodicals that may be just as good as the ones I have mentioned, but I am not so well acquainted with them, perhaps because I have not had them, as I have those I have mentioned, all my life.

You may be surprised that I do not enumerate any of the magazines. To tell the truth, dear friends, I have not yet seen a magazine that seems to inculcate on every page such a high standard for the home as the periodicals I have mentioned. I have also omitted a great list of religious periodicals, and the principal reason is so many of them accept and continue a class of advertising that would not be accepted by our best farm papers, such as I have mentioned. I do take a daily paper, but I do so under

protest. I have written to several of our great city dailies, saying that, when one could be found that rejects whisky advertising, I would use all my influence to get people to subscribe for it.

Among the others, I shall have 25 or 30 poultry-papers. At the present writing I have found only two that are willing to lose some of their advertising by coming out boldly against swindles and frauds. One of these is *Poultry*, published at Peotone, Ills., and the other is the *Petaluma Poultry Journal*, published weekly at Petaluma, Cal.

Of course, I take, and shall always take, the *American Issue*, the exponent of the Anti-saloon League, Columbus, O.

Besides the above I shall take our home papers, the *Medina Gazette* and the *Manatee River Journal*, Bradentown, Fla.

Everybody should subscribe for and help along one or more of the papers published in their own town. If they are not what they ought to be, turn in and help the editor make them better.

KIND WORDS.

We enjoy your Home talks in GLEANINGS. Advice and pointers coming from one who has raised a family, and knows what that means, comes as encouragement to us younger inexperienced fathers and mothers. May your life be spared to continue your part of GLEANINGS. MRS. C. E. CARLSON.
Keokuk, Iowa, Dec. 1.

HELPED TO MAKE THEIR VILLAGE DRY.

I just finished the Home paper, which I have read with much enjoyment for several years, and I sincerely agree with Brother Thatcher in saying you can not write too much. I think your temperance pieces are simply priceless, and it may interest you to know we just voted our little village dry. Your temperance paper helped to give us more strength and courage, and I feel in duty bound to tell you this.

Gypsum, Colo., Nov. 6.

BIRDIE HOCKETT.

"THE OLD SCHOOL."

Mr. Root:—Your circular letter came just as I was starting to the Central Illinois Horticultural meeting. I had a paper before the convention on natural aids to the fruit-grower, and it is needless to say the honey-bee took the first place. I have read GLEANINGS for 18 years, though not a subscriber that long; and of the hundreds of papers and magazines that come to my desk each month, none of them are valued higher than GLEANINGS, and only two others are considered worthy of saving and binding.

Mr. A. I. Root's department is one of the best and most helpful of any similar department I know of, and his articles can not help being beneficial for the up-building of the home life, which, by the way, is the one important thing. He belongs to "the old school" that has not forgotten the golden rule; and I trust he may be spared to continue many years in his excellent work.

Normal, Ill., Nov. 21.

A. M. AUGUSTINE.

AN INSPIRATION TO DO GOOD AND BE GOOD.

I should be sorry to lose a single copy of your journal, as everything you write is so good and healthy, especially your notes on home and health. I also thank you from the bottom of my heart for the way you have treated, and the stand you have taken on temperance, on cutting out fake advertisements, patent medicine, etc. May God give you power and strength to continue for many years to come. You don't know the amount of good you are doing. The world seems to be crying out for good honest men, for they are so few, and we need them so much in our Sunday-schools, our pulpits, our governments, in every walk of life; and your papers seem to give one an inspiration to be good and do good.

Vancouver, B. C., Nov. 1.

GEO. SCHOFIELD.

FROM "COVER TO COVER," COVERS INCLUDED.

I write to return our thanks for your very unexpected kindness in the matter of GLEANINGS. It is always read in this home from cover to cover—when we have it. By the way, the covers are charming themselves.

We have felt the touch of your personality ever since the far-away days in Tabor, Iowa, where our little apiary was laid out on the terraces of our hillside home, after the pattern shown in the A B C and GLEANINGS, and where, into the life midst of our discussions of "comb foundation" and "bee-queens," came the call that made us wanderers on the earth. The bees went with us to our first pastorate, where several colonies were stolen one Sunday night. We never moved the bees again; but in spite of the loss by theft they did famously for us those years; and Mr. Bosworth was helped to get into close touch with men by what he could do for them among the bees, helping them "transfer," selling to them and introducing for them Italian queens, and extracting honey for them. He paid \$5.00 for his queen.

The only time I ever saw you face to face was at Arthur T. Reed's Fourth-of-July meeting at Thompson, O., when you rode out on your wheel to be present, and afterward wrote it up for GLEANINGS.

I am not getting old—not at all—but I fear I am getting garrulous—with my pen. MRS. L. A. M. BOSWORTH.

Neosho Falls, Kas., Nov. 23.

Before buying your Comb Foundation, or disposing of your beeswax, be sure to get our prices on wax and foundation, or our prices on working wax into foundation.

We are also in a position to quote you prices on hives, sections, and all other supplies. We give LIBERAL DISCOUNTS during the months of December, January, and February.

Remember that
